

Systems Biology Graphical Notation: Process Description language Level 1

Version 2.0

Date: August 13, 2016

Disclaimer: This is a working draft of the SBGN Process Description Level 1 Version 2.0 specification. It is not a normative document.

Introduction

With the rise of systems and synthetic biology, the use of graphical representations of pathways and networks to describe biological systems has become pervasive. It was therefore important to use a consistent notation that would allow people to interpret those maps easily and quickly, without the need of extensive legends. Furthermore, distributed investigation of biological systems in different labs as well as activities like synthetic biology, that reconstruct biological systems, need to exchange their descriptions unambiguously, as engineers exchange circuit diagrams. 5

The goal of the Systems Biology Graphical Notation (SBGN) is to standardize the graphical/visual representation of biochemical and cellular processes. SBGN defines comprehensive sets of symbols with precise semantics, together with detailed syntactic rules defining their use. It also describes the manner in which such graphical information should be interpreted. SBGN is made up of three different and complementary languages [1]. This document defines the *Process Description* visual language of SBGN. Process Descriptions are one of three views of a biological process offered by SBGN. It is the product of many hours of discussion and development by many individuals and groups. 10 15

1.0.1 What are the languages?

PD is a language that permits the description of all the processes taking place in a biological system. The ensemble of all these processes constitute a Description. **ER** is a language that permits the description of all the relations involving the entities of a biological system. The ensemble of all these relations constitute a Relationship. **AF** is a language that permits the description of the flow of activity in a biological system. 20

1.0.2 Nomenclature

The three languages of SBGN should be referred to as: 25

- the Process Description language.
- the Entity Relationship language.
- the Activity Flow language.

Abbreviated as:

- the PD language.
 - the ER language.
 - the AF language.
- 30

A specific representation of a biological system in one of the SBGN languages should be referred to as:

- a Process Description map. 35

- an Entity Relationship map.
- an Activity Flow map.

Abbreviated as:

- a PD map.
- an ER map.
- an AF map.

The corpus of all SBGN representations should be referred to as:

- Process Descriptions.
- Entity Relationships.
- Activity Flows.

The capitalization is important. PD, ER and AF are names of languages. As such they must be capitalized in English. This is not the case of the accompanying noun (language or map).

1.1 SBGN levels and versions

It was clear at the outset of SBGN development that it would be impossible to design a perfect and complete notation right from the beginning. Apart from the prescience this would require (which, sadly, none of the authors possess), it also would likely need a vast language that most newcomers would shun as being too complex. Thus, the SBGN community followed an idea used in the development of other standards, i.e. stratify language development into levels.

A *level* of one of the SBGN languages represents a set of features deemed to fit together cohesively, constituting a usable set of functionality that the user community agrees is sufficient for a reasonable set of tasks and goals. Within *levels*, *versions* represent evolutions of a language, that may involve new glyphs, refined semantics, but no fundamental change of the way maps are to be generated and interpreted. In addition new versions should be backwards compatible, i.e., Process Description maps that conform to an earlier version of the Process Description language within the same level should still be valid. This does not apply to a new level.

Capabilities and features that cannot be agreed upon and are judged insufficiently critical to require inclusion in a given level, are postponed to a higher level or version. In this way, the development of SBGN languages is envisioned to proceed in stages, with each higher levels adding richness compared to the levels below it.

1.2 Developments, discussions, and notifications of updates

The SBGN website (<http://sbgn.org/>) is a portal for all things related to SBGN. It provides a web forum interface to the SBGN discussion list (sbgn-discuss@googlegroups.com) and information about how anyone may subscribe to it. The easiest and best way to get involved in SBGN discussions is to join the mailing list and participate.

Face-to-face meetings of the SBGN community are announced on the website as well as the mailing list. Although no set schedule currently exists for workshops and other meetings, we envision holding at least one public workshop per year. As with other similar efforts, the workshops are likely to be held as satellite workshops of larger conferences, enabling attendees to use their international travel time and money more efficiently.

Notifications of updates to the SBGN specification are also broadcast on the mailing list and announced on the SBGN website.

Language Overview

To briefly describe what SBGN Process Description language is about, let's give a brief overview of some of the relevant concepts with the help of an example shown in Figure 2.1. It is a simple map for part of a mitogen-activated protein kinase (MAPK) cascade. The larger nodes in the figure (some of which are in the shape of rounded rectangles and others in the shape of circles) represent biological materials—things like macromolecules and simple chemicals (NB: the nodes representing physical entities (or proxies to physical entities) will always be colored in yellow in this document. Color is not part of the SBGN specification though). The biological materials are altered via processes (colored in green in this document), which are indicated in Process Description language by lines with arrows and other decorations. In this particular map, all of the processes happen to be the same: processes catalyzed by biochemical entities. The directions of the arrows indicate the direction of the processes; for example, unphosphorylated RAF kinase proceeds to phosphorylated RAF kinase via a process catalyzed by RAS. Although ATP and ADP are shown as incidental to the phosphorylations on this particular graph, they are involved in the same process as the proteins getting phosphorylated. The small circles on the nodes for RAF and other entity pools represent state variables (in this case, phosphorylation sites).

The essence of the Process Descriptions is *change*: it shows how different entities in the system process from one form to another. The entities themselves can be many different things. In the example of Figure 2.1, they are either pools of macromolecules or pools of simple chemicals, but as will become clear later in this chapter, they can be other conceptual and material constructs as well. Note also that we speak of *entity pools* rather than individuals; this is because in biochemical network models, one does not focus on single molecules, but rather collections of molecules of the same kind. The molecules in a given pool are considered indistinguishable from each other. The way in which one type of entity is transformed into another is conveyed by a *process node* and arcs between entity pool nodes and process nodes indicate an influence by the entities on the processes. In the case of Figure 2.1, those arcs describe consumption (Section 4.5.34), production (Section 4.5.34) and catalysis (Section 4.5.35), but others are possible. Finally, nodes in Process Descriptions are usually not repeated; if they do need to be repeated, they are marked with *clone markers*—specific modifications to the appearance of the node (Section 4.5.38). The details of this and other aspects of Process Description notation are explained in the rest of this chapter.

A reference card depicting all the symbols of SBGN Process Description Level 1 is present at the end of this document.

Lets look at a few additional examples which show typical biological processes and their SBGN Process Description representation. In Figure 2.2 a reversible reaction with two substrates and one product is shown. The enzyme E catalyzes an irreversible (metabolic) process which consumes two substrates (S1 and S2) and produces one product (P1). The enzyme is a protein, therefore represented as a *macromolecule*. Substrates and product of the biochemical reaction are represented

Figure 2.1: This example of a Process Description uses two kinds of entity pool nodes: one for pools of different macromolecules (Section 4.5.17) and another for pools of simple chemicals (Section 4.5.13). Most macromolecule nodes in this map are adorned with state variables (Section 4.5.29) representing phosphorylation states. This map uses one type of process node, the process (Section 4.5.26), and three kind of connecting arc, consumption (Section 4.5.34), production (Section 4.5.34) and catalysis (Section 4.5.35). Finally, some entity pool nodes have dark bands along their bottoms; these are clone markers (Section 4.5.38) indicating that the same pool nodes appear multiple times in the map.

by *simple chemicals*. The consumption of S1 and S2 is represented by the *consumption arcs*. The *production arc* represents the synthesis of P1.

In Figure 2.3 the formation of a complex is shown. Two *macromolecule* entities X and Y form the *complex* X₂Y. Complex formation is represented using the *association* process node with ingoing *consumption* and outgoing *production* arcs. The *complex* glyph surrounds subunits X and Y.

5

Figure 2.2: This example of a Process Description shows an irreversible catalysis with 2 substrates and 1 products.

In Figure 2.4 the regulation of a target gene by a transcription factor without knowledge about the promoter binding is shown. A transcription factor (TF) protein together with a target gene promoter X triggers the *process* of transcription. Direct binding of the TF to the target gene promoter has not been experimentally verified, therefore the *logical operator* AND is used to describe the yet unspecified interaction between TF and target gene. The TF protein is a *macromolecule* of the *material type* 'protein' (mt:prot) whereas the gene promoter is given as a *nucleic acid feature* with

10

Figure 2.3: This example of a Process Description shows an irreversible catalysis with 2 substrates and 1 products.

the *conceptual type* 'gene' (ct:gene). The connecting arc *necessary stimulation* is applied to indicate that the stimulation by both regulator and target is necessary for the transcription process to take place. The target gene messenger as a product of the transcription process is represented by a *nucleic acid feature* with the *conceptual type* 'mRNA' (ct:mRNA). The *unspecified source* symbol is used to represent the large number of substrates of a transcription process (i.e. trinucleotides).

A last example is show in Figure 2.5, which shows passive transport or diffusion of a molecule. The *macromolecule* X in the cytosol serves as the substrate of a process leading to the production of the *macromolecule* X in the nucleus. This process describes the passive transport of X from one *compartment* to the other. The two macromolecules X do not carry the clone marker because the containing compartment is part of their identity.

More examples can be found in a list of so called SBGN bricks [2], which are building blocks representing basic biological patterns. These bricks can be used for assembly into different kinds of biological networks such as metabolic and regulatory networks.

Figure 2.4: This example of a Process Description shows a regulation of a target gene by a transcription factor without knowledge about the promoter binding.

Figure 2.5: This example of a Process Description shows a passive transport of a molecule.

In the above examples of biological processes a number of different glyphs where used to illustrate different biological entities: the macromolecule, the simple chemical and the gene.

What's New

3.1 Introduction

This version of the Process Description language is a significant revision of the previous version of the standard. It includes new and updated glyphs, updated and clarified semantics and most obviously this radically revised specification document. Below we provide more details about the these changes. 5

3.2 Specification

The previous version of the specification suffered from a number of deficiencies: 10

1. It was redundant and in places inconsistent. The glyph and grammars section described the same language rules, but these descriptions were sometime inconsistent.
2. It was hard for the reader to find rules as they were spread between the glyph and grammar sections.
3. The specification contained a number of ambiguities such as when an EPN was the same or whether the Phenotype could be cloned. Such ambiguities arose partly because some concepts like the type of an EPN were not explicitly defined. 15
4. Some rules were difficult to articulate in prose and a UML based description allows us to articulate such rules explicitly and in a unified description with the other concepts in the language. 20

This specification addresses such problems by putting the language rules and glyph description in one place (chapter 4) and based the language definition on a UML class model. The approach taken and the motivation is described in more detail in section 4.1.

3.3 Glyphs

Annotation (New) This version sees the introduction of the annotation glyph. This makes the Process Description language consistent with the other SBGN languages. The glyph provides a mechanisms to annotate parts of an SBGN map and does not affect the meaning of the map. See section 4.5.30. 25

State Variable The symbol used for this glyph has been modified to use the stadium (or capsule) glyph. This replaces the ellipse although the circle is preserved (it can be thought of as a special form of the stadium symbol with no straight edges). More details can be found in section 4.5.29.

Small Molecule The small molecule glyph has been changed from a circle to a stadium symbol. The circle had the drawback of taking up a lot of space if the author wanted to draw the label inside the shape. Also if the circle was deformed it became an oval, which is the symbol of a Unspecified Entity. The new glyph does not have either of these problems and can also adopt a circle shape if the straight lined have zero length. See section 4.5.13.

Empty Set The empty set glyph is a rationalisation of the source and sink glyphs, which both have the same symbol. They are now represented by the same glyph and the usage rules have been relaxed. More details can be found in section 4.5.11.

3.4 Rule Changes and Clarifications

Process Duplication The specification was unclear about whether a process could be duplicated. This situation could possibly arise if two processes were drawn that involved the same inputs, outputs and modulators. This is now clarified and all processes drawn in a map are unique and should be interpreted as describing different processes.

Phenotype Duplication The phenotype has, in previous specifications, been described as having a clone marker. This was inconsistent with the concept that a phenotype as a process, which cannot be cloned (see above). The specification has been revised accordingly (section 4.5.26).

Clarified Identity Semantics The specification was vague on when an author needed to use a clone marker. Especially when a macromolecule of the same name had material type or cardinality units of information. These rules have been expanded and the role of the cardinality and material type clarified. See section 4.7.

Subunits are not EPNs Previous specifications treated the subunit of a complex as a EPN. This was a mistake as the complex itself is the EPN and the subunits provide an illustrative guide of its composition. The specification has been revised to reflect this new understanding of the complex and its subunit decoration (see section 4.5.20).

Complex Identity There was an open question about how a complex was to be identified. This was important because the decision about whether to use a clone marker correctly relies on this. The complex is now identified solely by its name and states and the its subunit composition is ignored (see section 4.5.19).

Stoichiometry In the previous specification it was possible to define a stoichiometry as unknown and also it was assumed that the stoichiometry was unknown if it was not displayed. The current specification revises this rule so that the stoichiometry is assumed to be one if not displayed and also if specified the stoichiometry must be an integer (see section 4.5.34).

Submap rules simplified In previous specifications the submap was described as being an independent map, which shared the same namespace as its parent map. The rules for consistency checking between maps were under-defined there, but attempts to enumerate the rules led to an unacceptable increase in complexity. To simplify this situation the submap

is now assumed to be a mechanism to be used by software to collapse a region of detail in a given map. See section 4.5.24.

Language Specification

4.1 Introduction

In this chapter we aim to describe the Process Description language by describing its elements and underlying concepts in detail. The challenge in doing this is to provide enough detail to minimise ambiguity, but to also make the rules understandable to the users of the specification. An additional goal is to minimise duplication of rules as much as possible, which makes the specification more difficult to update in the future. To achieve this we took our lead from other successful standards: the Unified Modelling Language (UML) [3] (a graphical language that has been used by tens of thousands of software developers for almost two decades to describe software system); and the Systems Biology Markup Language [4] (SBML; the “daddy” of computational systems biological standards and almost 15 years after its inception it is firmly embedded in the scientific community it serves). Both languages specifications have similar approaches. The concepts and elements of the language are defined as classes and their interaction is described as relationships of containment, association or inheritance. In the case of UML, being a graphical language, the class descriptions also include a description of the symbols used with guidelines about how the symbols should be drawn or laid out. In this document we will also follow these precedents and take the following approach:

- The language will be described by a UML class model:
 - each language element or concept is represented as a class.
 - conceptual organisation is described by a generalisation relationship
 - syntax is defined by the cardinality of associations between classes.
- Each class is defined in detail, including a description of the concept or element represented, parent classes, attributes, interactions with other classes and any semantic rules that cannot be captured in UML.
- Where a class corresponds to a glyph, the symbol representing it is described and appropriate illustrations are provided.

4.2 Note on typographical convention

The concept represented by a glyph is written using a normal font, while a *glyph* means the SBGN visual representation of the concept. For instance “a biological process is encoded by the SBGN

PD *process*". A UML class name is written in camel case and presented as CamelCaseClassName. Attributes and associations are written in lower case, using the underscore to separate words: an_attribute.

Note that in drafts of this document the margin-note¹ is used to indicate that this part of the document may require special attention from the reader as it may contain material that is new or potentially contentious.

4.3 How to read the Language Specification

Here we will describe the elements of the class definitions that are the core of the language specification. Each definition starts with an introduction describing the purpose of the class and what it represents conceptually or physically. Its context within the Process Description language is then described by a detailed figure showing the class, its associations and its interaction with other key classes to help understand its context and any rules that are part of the definition. In these descriptions we will use a number of terms for which it makes sense to provide a brief glossary here:

class A class describes a set of objects that share the same specifications of features, constraints, and semantics (from the UML specification [3]).

subclass A class that inherits attributes, behaviour and associations from another class. For example in figure 4.1 "class C is a subclass of class A".

superclass A class that is an ancestor of another class. For example in figure 4.1 "class A is a superclass of class B".

generalisation A relationship in UML that defines a subclass/superclass relationship.

association A semantic relationship between two classes. Typically at least one, but often both classes require the other class to complete its definition.

instance An instance is equivalent to an object — a single example or realisation of a class.

role The role describes the nature of an association from the perspective of one of the classes in that relationship.

cardinality In the case of an attribute the number of separate values the attribute can hold and for an association the number of instances of each class that can be associated with each other. The permitted cardinality values are:

R Required (attributes only).

O Optional (attributes only).

1 required - only one instance is permitted (association only).

0..1 optional - zero or one instance is permitted (association only).

1..* at least 1 instance is required.

***** any number of instances are permitted.

type A type constrains the values represented by an attribute. For example an attribute of type int must have a value that is a integer.

Figure 4.1: An example of the UML elements used in this specification. The diagram is explained more fully in the text.

The UML class diagrams look like the examples in figure 4.1. Again as an aid to understanding their meanings are described below:

class See above for definition. The class symbol displays each attribute and its type using the convention: “attribute : type”.

generalisation (open triangle arrowhead) Defines an inheritance relationship where class C inherits the attributes, associations and semantics of class A. This means that C also has attributes attrib1 and attrib2 as well as an association called container to class B. 5

composite aggregation (black diamond) The aggregating class (A) is the one adjacent to the diamond and at the other end is the contained class (B). This represents a whole/part relationship where class B is part of class A and B cannot exist independently of A. The cardinality and role of a given class are shown at the opposite end of the association to it. 10

shared aggregation (open diamond) The aggregating class (C) is adjacent to the diamond and is connected to the other class (D) via a solid line. This represents a whole/part relationship (as above), but one where the ‘part’ (class D) can be shared with another class and can exist independently of C. 15

navigability (black diamond anchor arrowhead) If the association ends in an arrow, this indicates the direction of the association. This means that only one side of the association (G) is ‘aware’ of the relationship.

dependency Indicates that the dependent class (E) requires the other class adjacent to the arrow head (F) to satisfy its specification or implementation. 20

The specification uses a number of primitive types that are used in attribute definitions. These are:

int An integer.

string A string of Unicode characters.

boolean A Boolean value that can be either True or False. 25

object A type that can be any value.

¹The footnote contains a description of why this part of the specification is contentious, may require further discussion, or should be noted by the reviewer of the document.

cv A controlled vocabulary (see 4.6).

enum A value that must be chosen from one of an enumerated set of predefined values.

4.3.1 Definition format

To help you read the definitions each one follows a standard format which each section found in the same order. Sections that are not relevant are omitted.

5

Generalisation This section defines the inheritance relationship(s) between this class and any other classes.

Attributes Here any attributes specific to this class are defined and their meaning or purpose described. Attributes from superclasses are part of this class's definition but are not defined here explicitly.

10

Associations Any associations are defined and described. Again associations from superclasses are not included here, but are part of this class's definition.

Unique Key The attributes that together uniquely identify the Process Description element or concept. If this is omitted then there is no unique key. See section 4.7 for more information about identity and uniqueness.

15

Rules and Constraints The semantics of the class are defined here in the form of itemised rules and constraints on the behaviour of the class that are not expressed in the UML definition or other parts of the definition.

Notation If the class corresponds to one or more glyphs then each glyph is described here. The glyph is described in words and graphically. In cases where several glyphs combine in complex ways usage examples are provided.

20

Layout Rules and Guidelines In some cases the graphical layout of a glyph is more complicated and requires some additional explanation. If this is the case this will be provided here.

Changes from Previous Version In order to help track changes between versions of the specification this section documents where this class definition differs from that in previous versions. Where appropriate ticket numbers for bugs or issues addressed in this version should be included.

25

4.4 Overview of UML Description

The complete UML model describing the Process Description language is shown in figure 4.2. Care has been taken to try and represent the key concepts on the Process Description language while keeping the model as simple as possible, for example by minimising the use of multiple inheritance.

30

The model has a root class, `SBGNElement`, that all language elements inherit from. The nodes and arcs (edges) of the graph structure inherent in the language are represented by the `SBGNNode` and `SBGNArc` classes. All graphical elements that can be drawn directly onto a Process Description map are glyphs (`SBGNGlyph`) and all those that decorate glyphs are auxiliary units (`AuxiliaryUnit`). From there the model captures the organisation of glyphs into the Entity Pool Nodes (`EntityPoolNode`) and Process Nodes (`ProcessNode`) familiar in previous versions of the

35

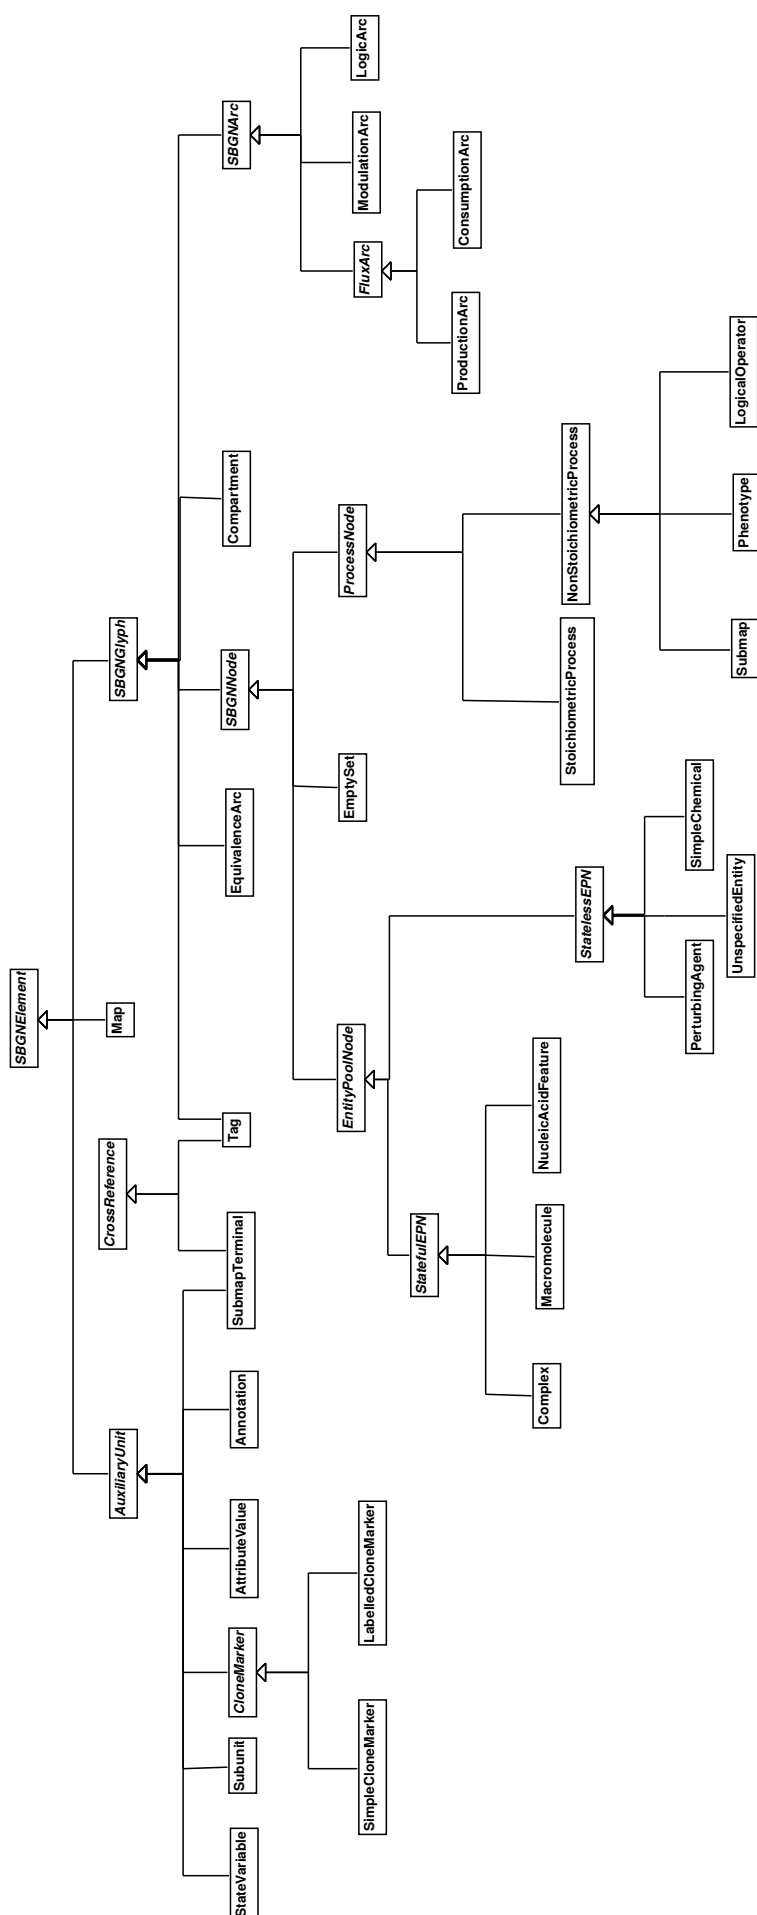

Figure 4.2: A view of the UML model describing Process Description language. This diagram shows the classes and their inheritance relationships. No attributes or associations between classes are shown to simplify the diagram. These details are provided in the UML class diagrams associated with most class definitions.

Process Description language specification. In most cases 'leaf' classes (those without any sub-classes) correspond to the glyphs of the language and in all cases non-leaf classes are concepts the define the syntax and semantics of one or more glyphs.

NonStoichiometricProcess, 36	

4.5.2 SBGNElement

All the glyphs in SBGN Process Description Level 1 inherit from **SBGNElement**². This is an abstract or conceptual class that helps organise Process Description conceptually. **SBGNElement** (figure 4.3) has a single attribute **id** that is an identifying attribute. This means that all SBGN elements defined here, which ultimately extend **SBGNBase**, can all be uniquely identified from each other. This makes sense if you think that a glyph drawn on a map is distinct from another glyph drawn on the map. The **id** attribute reflects this and is not shown explicitly in a Process Description map.

10

Generalisation

None

15

²A new concept

Attributes

id: identifier (**R**) uniquely identifies all SBGN elements in the same namespace³.

Changes from Previous Version

Not defined in the previous version.

4.5.3 Map

5

Figure 4.3: UML definition of Map and SBGNElement.

The Map⁴ (figure 4.3) is a container that holds all the glyphs (SBGNGlyph (see section 4.5.4)) drawn in a Process Description map. The elements held should be logically unique and conform to the identity rules in section 4.7.

Generalisation

- SBGNElement (see section 4.5.2)

10

Attributes

No additional attributes

Associations

elements:SBGNGlyph (*) The collection of glyphs held by the map.

Rules and Constraints

15

PD01 A map is valid if it is empty (although not very useful).

PD02 All instances of SBGNGlyph (see section 4.5.4) must be unique (see section 4.7).

³Not defined previously, but doesn't change Process Description semantics. reinforces the idea of instance identity that exists for all glyphs.

⁴Defining this explicitly is new, but the concept of the map as a container of glyphs has always existed in the Process Description language

Notation

The map is the canvas upon which the Process Description language is drawn. It's only visible feature is its colour. It can take any pattern or colour (or be transparent for that matter), but as SBGN is 'colour blind' this does not convey any meaning in itself.

Changes from Previous Version

5

Not defined explicitly in previous versions.

4.5.4 SBGNGlyph

Figure 4.4: UML definition of the SBGNGlyph and its subclasses.

The SBGNGlyph is the fundamental building blocks of the Process Description language. It is the only element that can be drawn directly on a map (Map (see section 4.5.3)).

Generalisation

10

- SBGNElement (see section 4.5.2)

Attributes

No additional attributes.

Associations

owning_map:Map (1) The map that contains this class.

15

Rules and Constraints

No additional rules and constraints.

Changes from Previous Version

Not defined in previous version.

4.5.5 AuxiliaryUnit

Figure 4.5: UML definition of the Auxiliary Unit and its subclasses.

The **AuxiliaryUnit** (figure 4.5) represents symbols that may be used to adorn glyphs. In doing so they change the meaning of the glyph and/or provide additional information about it.

5

Generalisation

- **SBGNElement** (see section 4.5.2)

Attributes

No additional attributes.

Associations

No additional associations.

10

Rules and Constraints

No additional rules and constraints.

Changes from Previous Version

Not defined in previous version.

15

4.5.6 SBGNNode

The **SBGNNode** (figure 4.6) represents the nodes in the graph structure that is the core representation within the Process Description language. The nodes are connected to glyphs descended from **SBGNArc** for form a direct graph.

Figure 4.6: UML definition of the SBGNNode and SBGNArc classes.

Generalisation

- SBGNGlyph (see section 4.5.4)

Attributes

No additional attributes.

Associations

out_arcs:SBGNArc (*) The arcs leaving this node.

in_arcs:SBGNArc (*) The arcs entering this node.

Rules and Constraints

PD03 The set of SBGNNodes linked to this node via a SBGNArc (its adjacent nodes) must be all belong to different entity pools (as defined by EntityPoolNode).

5

10

Changes from Previous Version

Not defined in the previous version.

4.5.7 SBGNArc

The SBGNArc (figure 4.6) represents the directed arcs (also know as directed edges) in the directed graph structure that is the core representation within Process Description language. The arc is connected to two nodes descended from SBGNNode, one at each end. As the arc has a direction these nodes are by convention designated the out_node to indicate the nodes that the arc is leaving and in_node to indicate the node that it is entering.

15

Generalisation

- SBGNGlyph (see section 4.5.4)

20

Attributes

No additional attributes.

Associations

out_node:SBGNNode (1) The node this arc is leaving.
 in_node:SBGNNode (1) The node this arc is entering.

Rules and Constraints

No additional rules and constraints.

5

Changes from Previous Version

Not defined in the previous version.

4.5.8 EntityType

Figure 4.7: UML definition of the entity type and the state variable definition. The diagram shows how these classes interact with the entity pool, state variable and so influence EntityPoolNode logical identity.

See footnote.

The EntityType⁵ defines the type of entity instantiated by one or more Entity Pools in a Process Description map. The EntityType has associated state variable definitions (see figure 4.7) and this enforces one of the core rules in the Process Description language that once a state is associated with an entity type it must be used by all entity pools of that type.

10

Generalisation

None.

Attributes

15

name: string (R) The name that identifies the entity in the Process Description map. EPNs with the same label should be from the same entity. The string cannot be empty and must start and end with a non-space character. Any Unicode character is acceptable⁶.

See footnote.

⁵The concept of an entity pool's type has been there implicitly in previous versions and comes up in discussions. This class aims to formalise that concept and the rules associated with it and enable us to formalise rules associated with EPNs.

⁶Not discussed or defined anywhere, but would make sense to define this explicitly.

natures: cv(*) The nature of the entity pool node as defined by a controlled vocabulary. Zero, one or more values may be set, but each one must belong to a different controlled vocabulary (see section 4.6)⁷.

⚠
See
footnote.

Associations

state_definitions:StateVariableDefintion (*) The state definitions associated with this type. 5
pools:EntityPoolNode (1..*) The entity pool nodes that used this type.

Unique Key

- name
- natures

Rules and Constraints

10

PD68 All instances of EntityPoolNode associated with a particular EntityType must be of the same class.

PD69 If an instance of EntityType contains one or more instances of StateVariableDefinition then the EntityPoolNodes associated with it must be subclasses of StatefulEPN.

Notation

15

Although there is no direct graphical representation of this class, other classes that have a composite aggregation with it will need to represented the natures of the type graphically. Because this attribute is of class AttributeValue each nature is shown as a separate *Unit of Information*.

Changes from Previous Version

Although not defined explicitly in the previous version, this concept and the associated rules did exist in the language. 20

4.5.9 StateVariableDefinition

The StateVariableDefinition⁸ defines the state variables used by an EntityType and therefore those state variables that must exists in an EntityPoolNode (see figure 4.7).

⚠
See
footnote.

Generalisation

25

None.

Attributes

name: string (O) The name that of the state variable. This is optional, but if defined cannot be an empty string or just white space characters. It should also start with an alpha-numeric character and end with a non-space character. It should not contain a '@' character⁹. 30

⚠
See
footnote.

⁷This has been discussed on the mailing list where this seems to be the consensus solution

⁸As with EntityType this is new and aims to formalise the concept that an entity pool must preserve the same state variables whenever it is used.

⁹No rule defined previously, but this would seem to make sense.

Associations

owning_entity_type:EntityType (1) The EntityType that owns this definition.

Rule and Constraints

None.

Changes from Previous Version

5

Although not defined explicitly in the previous version, arguably this concept did exist in the language.

4.5.10 EntityPoolNode

An entity pool is a population of entities that cannot be distinguished from each other, when it comes to the SBGN Process Description Level 1 map. For instance all the molecular entities that fulfill the same role in a given process form an entity pool. As a result, an entity pool can represent different granularity levels, such as all the proteins, all the instances of a given protein, only certain forms of a given protein. To belong to a different compartment is sufficient to belong to different entity pools. Calcium ions in the endoplasmic reticulum and calcium ions in the cytosol belong to different entity pools when it comes to representing calcium release from the endoplasmic reticulum.

10

15

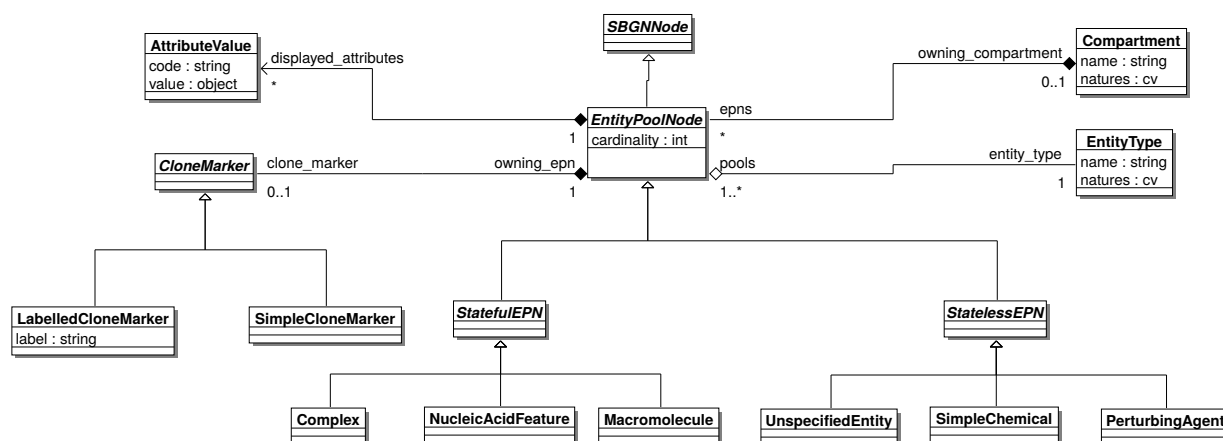

Figure 4.8: UML definition of the entity pool node and its descendant glyphs.

The EntityPoolNode (figure 4.8) is the definition of the entity pool and it shares an EntityType with other identical entities¹⁰. An instance of an entity pools is therefore distinguished from other pools with the same entity type by its cardinality, its owning_compartment and the values of its StateVariables (where appropriate). It must belong to a compartment or be associated with the map (c.f. section 4.5.27) and can contain a clone marker if it is cloned (see section 4.7)— note that not all EPNs can be cloned.

20

Generalisation

- SBGNNode (see section 4.5.6)

¹⁰Although this concept is discussed it is not explicitly defined previously.

Attributes

cardinality: int (**R**) The number of copies of the entity. Must be a positive non-zero integer.

Associations

owning_compartment:Compartment (0..1) The compartment that this EPN belongs too.

entity_type:EntityType (1) The type of this entity pool. 5

clone_marker:CloneMarker (0..1) The clone marker decorator. See section 4.5.38 for its use.

displayed_attributes:AttributeValue (*) One or more decorators used to display attribute values¹¹.

Unique Key

- owning_compartment
- entity_type
- cardinality

10

Rules and Constraints

PD04 If cardinality > 1 then the descendant glyph must be displayed as a multimer.

PD05 If the EPN is drawn directly on a *Map* then owning_compartment is not set. We interpret this as belonging to an invisible default compartment. 15

PD06 natures can only use the material type (section 4.6.1), conceptual type (section 4.6.2) or physical characteristics (section 4.6.4) controlled vocabularies.

PD07 The appropriate subclass of CloneMarker must be used to distinguish logically identical instances of this class.

PD08 All StateVariableDefinitions associated with the EntityType must have an associated StateVariable. 20

Changes from Previous Version

Not defined explicitly in the previous version, but the concept of the EPN and its semantics existed. The main change to previous semantics is that of the natures, which didn't formally exist before, but which now must contain a unique set of controlled vocabularies and is part of the logical key 25 of the EntityPoolNode.

4.5.11 EmptySet

It is useful to have the ability to represent the creation of an entity or a state from an unspecified source, that is, from something that one does not need or wish to make precise. For instance, in a model where the production of a protein is represented, it may not be desirable to represent all 30 of the amino acids, sugars and other metabolites used, or the energy involved in the protein's creation. Similarly, we may not wish to bother representing the details of the destruction or decomposition of some biochemical species into a large number of more primitive entities, preferring instead to simply say that the species "disappears into a sink". Yet another example is that one

¹¹This is an alternate way of using the Unit of Information to display information, but to constrain it so that it presents attributes of the EPN not general annotation. See the AttributeValue class for more information.

may need to represent an input (respectively, output) into (resp. from) a compartment without explicitly representing a transport process from a source (resp. to a target).

For these and other situations, SBGN defines a single glyph to handle these situations representing the involvement of an external pool of entities. The symbol used in SBGN is borrowed from the mathematical symbol for “empty set”, but it is important to note that it does not actually represent a true absence of everything or a physical void—it represents the absence of the corresponding structures in the model, that is, the fact that the external pool is conceptually outside the scope of the map.

A frequently asked question is, why bother having an explicit symbol at all? The reason is that one cannot simply use an arc that does not terminate on a node, because the dangling end could be mistaken to be pointing to another node in the map. This is specially true if the map is rescaled, causing the spacing of elements in the map to change. The availability and use of an explicit symbol for sources and sinks is critical.

Figure 4.9: The UML definition of the *EmptySet* and its context in relation to other elements of the Process Description language.

The definition of the *Empty Set* is shown in figure 4.9. The empty set is not a subclass of *EntityPoolNode* as it does not represent a single pool of entities and does not share any of the other attributes of an *EntityPoolNode*, nor does it belong to a particular compartment¹².

⚠
See
footnote.

Generalisation

- SBGNNode (see section 4.5.6)

Attributes

No additional attributes.

Associations

No additional associations.

Rules and Constraints

PD09 All instances of *Empty Set* can be regarded as identical therefore no special decoration is used to indicate replication on the map.

¹²This is a significant change to the semantics from v1.3 since it is no longer an EPN.

PD10 The EmptySet must be associated with at least one SBGNArc (see section 4.5.7) (degree > 0).

Notation

Glyph: *Empty Set*

SBO Term: SBO:0000291 ! empty set

5

Container: Represented by the mathematical symbol for “empty set”, that is, a circle crossed by a bar linking the upper-right and lower-left corners of an invisible square drawn around the circle (\emptyset). Figure 4.10 illustrates this. The symbol should be linked to one and only one edge in a map.

Label: None

10

Figure 4.10: The *empty set* glyph.

Changes from Previous Version

The EmptySet and *Empty Set* glyph has replaced the *Source* and *Sink* glyphs. This symbols used remains the same, but the underlying concept has changed. The *Source* and *Sink* glyphs where types of EPN, representing single entity pools, while the EmptySet is not.

4.5.12 StatelessEPN

15

The StatelessEPN (figure 4.11) represents a pool where the entities do not change ‘state’. In other-words the entities do not undergo any physical change that is useful to record in a Process Description map. Therefore they cannot be assigned a state-variable.

Figure 4.11: UML definition of the stateless entity pool node and its descendant glyphs.

Generalisation

- EntityPoolNode (see section 4.5.10)

20

Attributes

No additional attributes.

Associations

No additional associations.

Rules and Constraints

5

PD11 If a clone marker is used it must be of type SimpleCloneMarker.

Changes from Previous Version

Not defined in the previous version.

4.5.13 SimpleChemical

A SimpleChemical is the ‘opposite’ of a macromolecule (Section 4.5.17): it is a chemical compound that is *not* formed by the covalent linking of pseudo-identical residues. Examples of simple chemicals are an atom, a monoatomic ion, a salt, a radical, a solid metal, a crystal, etc. 10

Generalisation

- StatelessEPN (see section 4.5.12)

Attributes

15

No additional attributes.

Associations

No additional associations.

Rules and Constraints

No additional rules and constraints.

20

Notation

There are two glyphs associated with SimpleChemical. The first *simple chemical monomer* is used when cardinality = 1 and the second *simple chemical multimer* is used when cardinality > 1.

Glyph: Simple chemical monomer

SBO Term: SBO:0000247 ! simple chemical 25

Container: A *simple chemical* is represented by a ‘stadium’ symbol: a circle split in two with a rectangle inserted between them (see figure 4.12). If desired the rectangle can have zero length and the symbol is then identical to a circle (Figure 4.12). To avoid confusion with the Unspecified Entity (4.5.14), this form of the glyph must remain a circle and cannot be deformed into an eclipse. 30

Label: The identification of the *simple chemical* is carried by an unbordered box containing a string of characters. The characters may be distributed on several lines to improve readability, although this is not mandatory. The label box has to be attached to the center of the circular container. The label is permitted to spill outside the container.

Figure 4.12: The Process Description glyph for *simple chemical monomer*. The stadium form and circular forms are shown, as are the cloned forms of the glyph.

Glyph: *Simple chemical multimer*

SBO Term: SBO:0000421 ! multimer of simple chemicals

Container: A *simple chemical multimer* is represented by two identical containers shifted horizontally and vertically and stacked one on top of the other. Figure 4.13 illustrates the glyph.

Label: The multimer carries an identifying label. The label is placed in an unbordered box containing a string of characters. The characters can be distributed on several lines to improve readability, although this is not mandatory. The label box must be attached to the center of the top monomer's container. The label may spill outside of the container.

Figure 4.13: The Process Description glyph for *simple chemical multimer*. The figures show the stadium and circular forms, and their cloned variants.

Changes from Previous Version

The glyphs used for the SimpleChemical have been changed to the stadium glyph. Previously the glyph was a circle. To maintain compatibility with previous versions the stadium symbol can be drawn without straight horizontal elements so that it becomes a circle.

4.5.14 UnspecifiedEntity

The simplest type of EntityPoolNode is the UnspecifiedEntity — one whose type is unknown or simply not relevant to the purposes of the map. This arises, for example, when the existence of the entity has been inferred indirectly, or when the entity is merely a construct introduced for the needs of a map, without direct biological relevance. These are examples of situations where the UnspecifiedEntity is appropriate. (Conversely, for cases where the identity of the entities composing the pool is known, there exist other, more specific glyphs described elsewhere in the specification.)

Generalisation

- StatelessEPN (see section 4.5.12)

Attributes

No additional attributes.

Associations

No additional associations.

Rules and Constraints

5

PD12 The `UnspecifiedEntity` cannot have cardinality > 1 . This means there is no multimer glyph.

Notation

Glyph: *Unspecified entity*

SBO Term: SBO:0000285 ! material entity of unspecified nature

Container: An *unspecified entity* is represented by an elliptic container, as shown in 4.14. Note 10
that this must remain an ellipse to avoid confusion with the Simple Chemical glyph, which is a circle (c.f. 4.5.13).

Label: An *unspecified entity* is identified by a label placed in an unbordered box containing a 15
string of characters. The characters can be distributed on several lines to improve readability, although this is not mandatory. The label box must be attached to the center of the container. The label may spill outside of the container.

Figure 4.14: The Process Description glyph for *unspecified entity*.

Changes from Previous Version

No changes from the previous version.

4.5.15 PerturbingAgent

Biochemical networks can be affected by external influences. Those influences can be the effect of 20
well-defined physical perturbing agents, such as a light pulse or a change in temperature; they can also be more complex and not well-defined phenomena, for instance the outcome of a biological process, an experimental setup, or a mutation. For these situations, SBGN provides the *perturbing agent* glyph. It is an EPN, and represents the amount to perturbing agent applied to a process.

Generalisation

25

- StatelessEPN (see section 4.5.12)

Attributes

No additional attributes.

Associations

No additional attributes.

Rules and Constraints

PD13 The PerturbingAgent cannot have cardinality > 1 . This means there is no multimer glyph.

Notation

5

Glyph: *Perturbing agent*

SBO Term: SBO:0000405 ! perturbing agent

Container: A *perturbing agent* is represented by a modified hexagon having two opposite concave faces, as illustrated in Figure 4.15.

Label: A *perturbing agent* is identified by a label placed in an unbordered box containing a string of characters. The characters can be distributed on several lines to improve readability, although this is not mandatory. The label box must be attached to the center of the *perturbing agent* container. The label may spill outside of the container. 10

Figure 4.15: The Process Description glyph for *perturbing agent*.

Changes from Previous Version

No changes from previous version.

15

4.5.16 StatefulEPN

Stateful entity pools can undergo physical changes, for example chemical modification or conformational change, which we wish to record in a Process Description map. This information is captured via the StateVariable (as can be seen in figure 4.16). The LabellecCloneMarker must be used to indicated that the StatefulEPN is cloned. 20

Generalisation

- EntityPoolNode (see section 4.5.10)

Attributes

No additional attributes.

Associations

25

states:StateVariable (*) The state variables that belong to this class.

Figure 4.16: UML definition of the stateful entity pool node: showing its descendants and its association with state variables.

Rules and Constraints

PD14 State variables do not need to be logically unique, therefore two or more state variables with the same name are permitted.

PD15 The `LabelledCloneMarker` must be used to indicate cloning for instances of `StatefulEPN` and its subclasses, with a must use the same

5

Changes from Previous Version

Not defined explicitly in the previous version.

4.5.17 Macromolecule

Many biological processes involve *macromolecules*: biochemical substances that are built up from the covalent linking of pseudo-identical units. Examples of macromolecules include proteins, nucleic acids (RNA, DNA), and polysaccharides (glycogen, cellulose, starch, etc.). Attempting to define a separate glyph for all of these different molecules would lead to an explosion of symbols in SBGN, so instead, SBGN Process Description Level 1 defines only one glyph for all macromolecules. The same glyph is to be used for a protein, a nucleic acid, a complex sugar, and so on. The exact nature of a particular macromolecule in a map is then clarified using its label and decorations, as will become clear below.

10

15

Generalisation

- `StatefulEPN` (see section 4.5.16)

Attributes

No additional attributes.

20

Associations

No additional associations.

Rules and Constraints

No additional rules and constraints.

Notation

There are two glyphs associated with **Macromolecule**. The first *Macromolecule monomer* is used when cardinality = 1 and the second *Macromolecule multimer* is used when cardinality > 1.

5

Glyph: *Macromolecule monomer*

SBO Term: SBO:0000245 ! macromolecule

Container: A macromolecule is represented by a rectangular container with rounded corners, as illustrated in Figure 4.17.

Label: A *macromolecule* is identified by a label placed in an unbordered box containing a string of characters. The characters can be distributed on several lines to improve readability, although this is not mandatory. The label box must be attached to the center of the container. The label may spill outside of the container.

10

Figure 4.17: The Process Description glyph for *macromolecule*, shown plain and unadorned on the left, and with an additional state variable and a unit of information in the middle and the cloned form on the right.

Glyph: *Macromolecule multimer*

SBO Term: SBO:0000420 ! multimer of macromolecules

15

Container: A *multimer* is represented by two identical containers shifted horizontally and vertically and stacked one on top of the other. Figure 4.18 illustrates the glyph.

Label: As monomer

Figure 4.18: The Process Description glyph for *macromolecule multimer*, shown plain and unadorned on the left, and with an additional state variable and a unit of information in the right and the cloned form on the right.

Usage Examples In this section, we provide examples of Entity Pool Node representations drawn using the SBGN Process Description Level 1 glyphs described above.

20

Figure 4.19 represents calcium/calmodulin kinase II, with phosphorylation on the sites threonine 286 and 306, as well as catalytic and autoinhibitory domains. Note the use of *units of information* and *state variables*.

Figure 4.20 represents the glutamate receptor in the open state, with both phosphorylation and glycosylation. The entity carries two functional domains, the ligand-binding domain and the ion pore, and its chemical nature is preceded.

25

Figure 4.19: An example representation of calcium/calmodulin kinase II.

Figure 4.20: An example of a glutamate receptor in the open state.

Changes from Previous Version

No changes from the previous version.

4.5.18 NucleicAcidFeature

The `NucleicAcidFeature` represents a fragment of a macromolecule carrying genetic information. A common use for this construct is to represent a gene or transcript. The label of this EPN and its natures are often important for making the purpose clear to the reader of a map.

Generalisation

- `StatefulEPN` (see section 4.5.16)

Attributes

No additional attributes.

Associations

No additional associations.

Rules and Constraints

No additional rules and constraints.

Notation

The `NucleicAcidFeature` has two associated glyphs. The first *Nucleic acid feature monomer* is used when cardinality = 1 and the second, *Nucleic acid feature multimer* is used when cardinality > 1.

Glyph: *Nucleic acid feature monomer* This glyphs represents a monomeric macromolecule.

SBO Term: SBO:0000354 ! informational molecule segment

Container: A *nucleic acid feature* is represented by a rectangular container whose bottom half has rounded corners, as shown in Figure 4.21.

Label: The identity of a particular *Nucleic acid feature* is established by a label placed in an unordered box containing a string of characters. The characters may be distributed on several lines to improve readability, although this is not mandatory. The label box must be attached to the center of the container. The label may spill outside of the container.

Figure 4.21: The Process Description glyph for *nucleic acid feature monomer*, shown plain and unadorned on the left and with an additional state variable and a unit of information in the middle and the cloned form on the right.

Glyph: *Nucleic acid feature multimer* This glyphs represents a multimeric macromolecule. 5

SBO Term: SBO:0000419 ! multimer of informational molecule segments

Container: A *Nucleic acid feature multimer* is represented by two identical containers shifted horizontally and vertically and stacked one on top of the other. Figure 4.22 illustrates the glyph.

Label: As monomer glyph.

Figure 4.22: The Process Description glyph for *nucleic acid feature multimer*, shown plain and unadorned on the left and with an additional state variable and a unit of information in the middle and the cloned form on the right.

Changes from Previous Version

10

No changes from the previous version.

4.5.19 Complex

A Complex represents a biochemical entity composed of other biochemical entities, whether simple chemicals, macromolecules, multimers, or other complexes (figure 4.23). The Complex can described its composition by the set of Subunits it contains (see figure 4.5.20). This description is entirely optional and is their to assist the user with a visual shorthand about the composition of the complex. 15

Generalisations

- EntityPoolNode (see section 4.5.10)

Attributes

20

No additional attributes

Figure 4.23: The UML definition of the **Complex** and its associated subunits. In particular this describes organisation of the state variables that belong to both the subunit, but also the complex.

Associations

subunits:Subunit (*) The subunits that describe the composition of this complex.

Rules and Constraints

PD16 Once a set of subunits are defined for an **Complex** with a given **EntityType**, then they must be used by every instance using that entity type.¹³.

PD17 The set of subunits in the **Complex** does not identify it. One or more **Complexes** that contain the same set of subunits, but have different labels are **not** identical.

Notation

The **Complex** is represented by two glyphs, the *Complex Monomer* which represents a **Complex** where the cardinality is one and the *Complex Multimer* where the cardinality is greater than that.

Glyph: Complex Monomer This glyphs represents a monomeric complex.

SBO Term: SBO:0000253 ! non-covalent complex

Container: A *complex* possesses its own container box surrounding the juxtaposed container boxes of its components. This container box is a rectangle with cut-corners (an octagonal box with sides of two different lengths). The size of the cut-corners are adjusted so that there is no overlap between the container and the components. The container boxes of the components must not overlap.

Label: The identification of a *named complex* is carried by an unbordered box containing a string of characters. The characters may be distributed on several lines to improve readability, although this is not mandatory. Ideally the label box should be attached to the midway between the border of the complex's container box and the border of the components' container boxes. However, if the **Complex** contains **Subunit** glyphs then the label may be positioned to optimise the clarity and avoid overlapping.

Glyph: Complex Multimer This glyphs represents a multimeric complex.

SBO Term: SBO:0000418 ! multimer of complexes

¹³New rule.

Figure 4.24: The *complex* glyph.

Container: A *Complex Multimer* is represented by two identical *Complex* containers shifted horizontally and vertically and stacked one on top of the other. Figure 4.25 illustrates the glyph.

Label: As monomer

Figure 4.25: The *Complex Multimer* glyph.

Layout Rules and Guidelines

PD18 The subunits inside the complex must not overlap.

5

PD19 The subunits should sit above the clone marker so that they are not obscured by it.

PD20 The label should not be obscured by subunits or obscure them.

Changes from Previous Version

- Clarified that complex must have a label and the label identifies the complex irrespective of its subunit composition.
- The label positioning does not need to be at the centre of the Complex glyph.

10

4.5.20 Subunit

The Subunit¹⁴ is used to describe the composition of the Complex (see section 4.5.19). A complex can optionally be decorated with one or more subunits, which represent the types of *EntityPoolNode* (see section 4.5.10) that may aggregate to form a complex. As we can see from the UML representation (figure 4.23) the Subunit is an auxiliary unit that decorates the Complex and does not represent an entity pool directly. In addition it does not mimic the *EntityPoolNode* class hierarchy (Subunit, but rather uses the `subunit_type` attribute to indicate the type of subunit.

15

Generalisation

- *EntityPoolNode* (see section 4.5.10)

20

¹⁴The principles of the subunit have been agreed, but the details of this implementation should be reviewed. In particular the rules about state variables.

Attributes

cardinality: int (**R**) The number of copies of the subunit.

name: string (**O**) The name of the subunit.

subunit_type: enum (**R**) The type of the subunit. It can have one of the following values that correspond to the equivalent EPN class: SimpleChemical, UnspecifiedEntity, PerturbingAgent, Macromolecule, NucleicAcidFeature, Complex.

5

Associations

owning_complex:Complex (1) The complex that owns the subunit.

states:SubunitStateVariable (*) The state variables assigned to this subunit.

children:Subunit (*) Subunits that are contained by this subunit.

10

Rules and Constraints

PD21 Two or more state variables with the same name are permitted.

PD22 State variables with no name set are permitted.

PD23 Subunits can also contain subunits. There is no limit on such nesting. The namespace rules below apply.

15

PD24 The subunit defines a namespace for its state variables, e.g. subunit “A” assigned a state variable “P@Ser202” and a subunit “B” assigned the same state variable can be distinguished as A:P@Ser202 and B:P@Ser202.

PD25 If the subunit is of type Complex then children can contain one or more Subunit instances.

PD26 If the subunit has a cardinality > 1 then this should be displayed by the AttributeValue (see section 4.5.28).

20

PD27 If natures contains one or more instances then these must be displayed via an AttributeValue.

Notation

The subunit symbol used for the *subunit* glyph varies depending on the subunit_type and cardinality. The symbols available are equivalent to those used by the EPN glyphs including the *complex*. Therefore it is possible to describe complexes within complexes. The mapping between these and the symbol used is shown in the table below. Note that subunits may contain labels corresponding to their name.

25

SimpleChemical	<i>Simple Chemical Monomer</i>	<i>Simple Chemical Multimer</i>
UnspecifiedEntity	<i>Unspecified Entity</i>	None
PerturbingAgent	<i>Perturbing Agent</i>	None
Macromolecule	<i>Macromolecule Monomer</i>	<i>Macromolecule Multimer</i>
NucleicAcidFeature	<i>Nucleic Acid Feature Monomer</i>	<i>Nucleic Acid Feature Multimer</i>
Complex	<i>Complex Monomer</i>	<i>Complex Multimer</i>

30

The example in figure 4.26 illustrates the use of subunits in a complex. It also shows an equivalent complex without subunits.

Figure 4.26: Both these complex glyphs are equivalent. The one on the left is described using subunit decorators, the one on the right describes the same thing without them.

Changes from Previous Version

In previous version of the spec the subunits of a **Complex** were regarded as an EPN. This however, is incorrect as it implies there are pools within pools, which breaks one of the fundamental paradigms of the Process Description language. This is corrected in the current version and subunits are now adornments of the **Complex**.

5

4.5.21 ProcessNode

The **Process** (figure 4.27) represents a process that transforms one or more entity pools into one or more entity pools, that are identical or different. A process may be used to represent or summarise more than one known process.

Figure 4.27: The UML definition of the **Process** and its associated subclasses. Note that the **Process** extends **SBGNNode** so all its descendants can potentially be nodes in a directed graph.

Generalisation

10

- **SBGNNode** (see section 4.5.6)

Attributes

No additional attributes.

Associations

No additional associations.

15

Rules and Constraints

No additional rules and constraints.

Changes from Previous Version

- This was not explicitly defined in the previous version, but this version did define a glyph called *Process*. To avoid ambiguity this glyph has now been renamed *Stoichiometric Process* (see section 4.5.26).
- Previous specifications stated that processed could be duplicated when all associated EPNs were cloned. This behaviour has been changed the current status where all processes are unique in a Process Description map.

4.5.22 NonStoichiometricProcess

The NonStoichiometricProcess¹⁵ (figure 4.28) is a type of process. It does not necessarily result in a measurable change of entity pools, nor does it necessarily have a defined start and end point. In many cases the process is not well defined. This may because it is not well understood or because the detail is not important or is being summarised.

⚠ See footnote.

Figure 4.28: The UML definition of the NonStoichiometricProcess and its associated subclasses.

Generalisation

- ProcessNode (see section 4.5.21)

Attributes

No additional attributes.

Associations

No additional associations.

Rules and Constraints

No additional rules and constraints.

Changes from Previous Version

Not defined in the previous version.

¹⁵This has been discussed and agreed in past meetings

4.5.23 Phenotype

A biochemical network can generate phenotypes or affect biological processes. Such processes can take place at different levels and are independent of the biochemical network itself. To represent these processes in a map, SBGN defines the **Phenotype** (figure 4.28).

Generalisation

5

- NonStoichiometricProcess (see section 4.5.22)

Attributes

name: string (**R**) The name of the phenotype.

Associations

No additional associations.

10

Unique Key

- owning_map
- name

Rules and Constraints

PD28 The number of in_arcs must be > 0.

15

PD29 in_arc can only contain instances of ModulationArc (see section 4.5.35) and its subclasses.

PD30 out_arcs must be empty.

Notation

Glyph: *Phenotype*

SBO Term: SBO:0000358 ! phenotype

20

Container: A *phenotype* is represented by an elongated hexagon, as illustrated in Figure 4.29.

Label: A *phenotype* is identified by a label placed in an unordered box containing a string of characters. The characters can be distributed on several lines to improve readability, although this is not mandatory. The label box must be attached to the center of the *phenotype* container. The label may spill outside of the container.

25

Figure 4.29: The Process Description glyph for *phenotype*.

Changes from Previous Version

This definition clarifies that the Phenotype cannot be cloned as it is now a subclass of Process, which is always unique.

4.5.24 Submap

The Submap (figure 4.30) represents a process or set of processes and is a mechanism for hiding the detail of a portion of a Process Description map. The Submap can be 'collapsed', in which case it acts as a placeholder in the map for the information it is hiding, or 'expanded' when the content of the submap is displayed. The node is linked to EPNs outside the submap that are also in the Submap. It is anticipated that a software tool will use these forms as a convenient way to hide and show portions of a large SBGN map.

Figure 4.30: The UML definition of the Submap and its relationship to its submap, tags etc.

Generalisation

- NonStoichiometricProcess (see section 4.5.22)

Attributes

name: string (R) The name of the submap that is being summarised. Note that this name ideally will indicate the function or the processes that are being summarised.

Associations

terminals: SubmapTerminal (1..*) The terminals show how the EPNs in the Main Map link to those in the collapsed submap, which are identified by a Tag.

Unique Key

- owning_map
- name

Rules and Constraints

PD31 All instances of SubmapTerminal (see section 4.5.32) held by this class must be logically unique.

PD32 in_arcs and out_arcs must be empty (i.e., degree = 0).

Notation

Glyph: Submap

SBO Term: SBO:0000395 ! encapsulating process

Container: The *submap* is represented as a square box to remind the viewer that it is fundamentally a process.

Label: The identification of the *submap* is carried by an unbordered box containing a string of characters. The characters may be distributed on several lines to improve readability, although this is not mandatory. The label box has to be attached to the center of the container box.

Figure 4.31: The Process Description glyph for *submap*. (a) the basic glyph symbol, without the *submap terminal* auxiliary units that would normally be associated with it. (b) The glyph as it would typically be used within a map — associated with EPN glyphs and containing *submap terminals*. (c) An expanded view of the submap showing its content.

Changes from Previous Version

The semantics of the Submap have been clarified and the ability of submaps to be independent of the main map has been removed¹⁶.

4.5.25 LogicalOperator

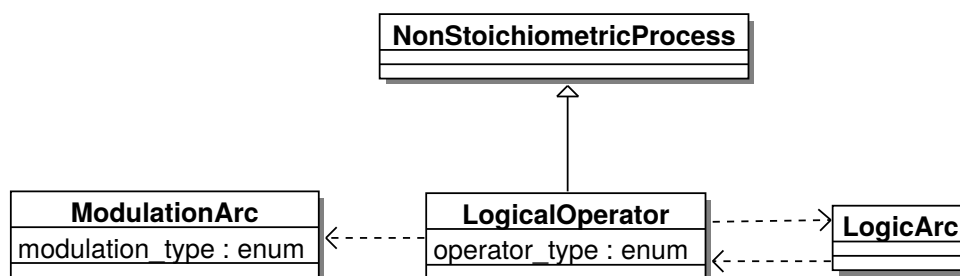

Figure 4.32: The UML definition of the LogicalOperator.

The LogicalOperator (figure 4.32) performs a Boolean operation on one or more inputs to give a binary output. The input must be a Boolean value, and are obtained from the LogicArc (see

¹⁶This change was agreed at SBN 10 in Los Angeles, 2014.

section 4.5.36) connected to the **LogicOperator**. The output a two-value quantity, 0 for False and positive non-zero for True. This is required because the output of the **LogicOperator** must be connected to either a **LogicArc** or a **ModulationArc** (see section 4.5.35) both of which require their out node to provide a quality. The behaviour of the logical operator for each type of **operator_type** is shown in the following table:

5

AND	All inputs must be True for output to be True, otherwise output is false.
OR	At least one input must be True for output to be True. If all inputs are False then output is False.
NOT	Only one input is permitted and the output is the inversion of the input. Therefore True gives False and False gives True.

Generalisation

- **NonStoichiometricProcess** (see section 4.5.22)

Attributes

operator_type: enum (**R**) The operator type must be one of the following enumerations: AND, OR, NOT. 10

Associations

No additional associations.

Rules and Constraints

PD33 **in_arc** can only contain one or more instances of **LogicArc**. 15

PD34 **out_arc** can only contain one or more instances of **LogicArc** or **ModulationArc**.

PD35 if **operator_type** is AND or OR, then **in_arc** must contain two or more arcs.

PD36 if **operator_type** is NOT then **in_arc** must contain only one arc.

PD37 **out_arc** can contain only one arc.

Notation 20

Three glyphs are used to represent the different operator types. The glyphs are names after the corresponding type.

Glyph: *And*

SBO Term: SBO:0000173 ! and.

Node: *And* is represented by a circle carrying the word “AND”. 25

Glyph: *Or*

SBO Term: SBO:0000174 ! or.

Node: *Or* is represented by a circle carrying the word “OR”.

Figure 4.33: The Process Description glyph for *and*. Only two inputs are represented, but more would be allowed.

Figure 4.34: The Process Description glyph for *or*. Only two inputs are represented, but more would be allowed.

Glyph: *Not*

SBO Term: SBO:0000238 ! not.

Node: *Not* is represented by a circle carrying the word “NOT”.

Figure 4.35: The Process Description glyph for *not*.

Changes from Previous Version

Although the LogicOperator was not explicitly defined in the previous version the semantics and glyphs are unchanged.

4.5.26 StoichiometricProcess

Figure 4.36: The UML definition of the StiochiometricProcess. The class interacts with subclasses of FluxArc and ModulationArc.

A stoichiometric process¹⁷ produces a measurable change in the quantities of entity pools consumed and produced. This might imply modification of covalent bonds (conversion), modification of the relative position of constituents (conformational process) or movement from one compartment to another (translocation). Such a process will have a basal rate at which this change

¹⁷New concept, but discussed in previous meetings. The semantics of the process being stoichiometrically balanced has not been discussed in detail for the stoichiometric process, and this is the subject of a tracker query. The spec previously stated that the process should be balanced and this is therefore consistent with that.

occurs, which can be affected positively or negatively by the other entity pools, which 'modulate' the process. Examples of this include stimulation, inhibition and catalysis. In an irreversible process the entity pools interacting with it can be grouped into inputs and outputs. However, a stoichiometric process can also be reversible and so for convenience we refer to these groupings as the “left-hand-side” (LHS) and “right-hand-side” (RHS) of the process¹⁸ (figure 4.37).

5

Figure 4.37: An illustration of the “sidedness” of a process. The designation of LHS and RHS is essentially arbitrary.

In the Process Description language this is represented by the `StoichiometricProcess` (figure 4.36). It can be one of several different types, which indicate the amount that is known about the process or in some cases the nature of the process, for example association and dissociation. The permitted values for `process_type` are described in the following table:

generic	A generic stoichiometric process that transforms a set of entity pools into another set of entity pools.
omitted	Omitted processes are processes that are known to exist, but are omitted from the map for the sake of clarity or parsimony. A single <i>omitted process</i> can represent any number of actual processes. The <i>omitted process</i> is different from a <i>submap</i> . While a <i>submap</i> references to an explicit content, that is hidden in the main map, the <i>omitted process</i> does not “hide” anything within the context of the map, and cannot be “unfolded”.
uncertain	Uncertain processes are processes that may not exist. A single <i>uncertain process</i> can represent any number of actual processes.
association	The association between one or more <i>EPNs</i> represents the non-covalent binding of the biological objects represented by those <i>EPNs</i> into a larger complex.
dissociation	The dissociation of an <i>EPN</i> into one or more <i>EPNs</i> represents the rupture of a non-covalent binding between the biological entities represented by those <i>EPNs</i> .

10

Since this process is stoichiometric the relative quantities of the entity pools participating the process must be specified. For this reason the `FluxArc` (see section 4.5.34) has an `stoichiometry` attribute and each `EntityPoolNode` (see section 4.5.10) has a `cardinality`, which should be balanced in a valid Process Description map. This is especially important where there is potential ambiguity in the stoichiometry of the process (figure 4.38).

15

¹⁸Note this designation is purely for grouping and is used even then the sides of the reaction are above and below the process.

Figure 4.38: The figure illustrates why for the stoichiometry label is required to clarify potentially ambiguous stoichiometry. In the top example there is more than one possible solution, which can only be made clear using the stoichiometry labels in the bottom examples.

A stoichiometric process is deemed to be reversible if its `in_arcs` are `FluxArcs` of type 'reversible' (see figure 4.39). Semantically, this permits a reversible flow of entities through the process. Modulation of a reversible process affects the rate of flux through the process, but does not directly affect the direction of that flow.

Figure 4.39: A valid reversible process. A process is reversible if its LHS and RHS contain only *production* arcs.

Generalisation

5

- `ProcessNode` (see section 4.5.21)

Attributes

`process_type`: enum (**R**) This must be one of the following enumerations: generic, omitted, uncertain, association, dissociation.

Associations

10

No additional associations.

Rules and Constraints

General

- PD38** The `in_arc` must contain one or more `FluxArcs` containing the same `flux_type` value.
- PD39** The `in_arc` may only contains `FluxArc` instances with a `flux_type` of 'consumption', or 'reversible'.
- PD40** The `in_arc` may only contains `FluxArc` instances with a `flux_type` of 'consumption', or 'reversible'. 5
- PD41** In addition the `in_arc` may contain zero, one or more instances of `ModulationArc`.
- PD42** The `out_arc` must contain one or more instances of `FluxArc` with a `flux_type` or 'production'.
- PD43** If `in_arcs` contains one or more `FluxArcs` of type 'reversible' this process reversible.
- PD44** The `EntityPoolNodes` that make up the LHS of the process should be consistent with the RHS, i.e. the process should be stoichiometrically balanced.¹⁹ 10
- PD45** If at least one `FluxArc` associated with a `StoichiometricProcess` displays its stoichiometry via a *stoichiometry label* then all must.²⁰
- PD46** If more than one set of stoichiometries can be applied to the flux arcs of the process then the stoichiometry of the flux arcs must be displayed. 15

Association These rules apply if the `process_type` is 'association'.

- PD47** The process must be irreversible.
- PD48** There can only be one 'production' `FluxArc`, with `stoichiometry` = 1.
- PD49** If a `Complex` is on the RHS of the association then there must be at least 2 EPNS on the LHS. *Is this too restrictive? It prevents multimers being represented as a complex of 2 identical subunits. It is taken from v1.0 of the spec and got lost in later versions.* 20

Dissociation These rules apply if the `process_type` is 'dissociation'.

- PD50** The process must be irreversible.
- PD51** There can only be one 'consumption' `FluxArc`, with `stoichiometry` = 1.
- PD52** If a `Complex` is on the LHS of the dissociation then there must be at least 2 EPNS on the RHS. *see comment in association rules.* 25

Notation

Glyph: Process

SBO Term: SBO:0000375 ! process

Note: A process is represented by a square box linked to two connectors: small arcs attached to the centers of opposite sides and referred to here as 'lugs'²¹. The flux arcs are linked 30

¹⁹Tracker issue 329060. If the process is stoichiometric this must make sense. The previous spec states this so this is consistent with it.

²⁰Take from previous spec, but that said if one displays stoichiometry in a map which is too restrictive.

²¹The term lugs is used in discussion. We haven't discussed this in detail or at least come to a consensus on it. In particular does the lug need to be perpendicular to the process and does it need to be a straight line? How should it be used when the arc connecting to it is curved.

to the ends of the lugs as shown in figure 4.40. The lug's purpose is to 'gather' the flux arcs together before meeting the process node proper and in doing so they emphasize the 'sides' of the reaction. Therefore the lug must have a visually appreciable length²² and must be placed on opposite sides of the process square. The modulatory arcs (section 4.5.35) point to the other two sides of the box.

5

Figure 4.40: The Process Description glyph for *process*.

The example in Figure 4.41 illustrates the use of a *process* node to represent the phosphorylation of a protein in a Process Description.

Figure 4.41: Phosphorylation of the protein MAP kinase.

The example in Figure 4.42 illustrates the use of a *process* node to represent a reaction between two reactants that generates three products.

Figure 4.42: Reaction between ATP and fructose-6-phosphate to produce fructose-1,6-biphosphate, ADP and a proton.

The example in Figure 4.43 illustrates the use of a *process* node to represent a translocation. The large round-cornered rectangle represents a compartment border (see Section 4.5.27). 10

The example in Figure 4.44 illustrates the use of a *process* node to represent the reversible opening and closing of an ionic channel in a Process Description.

When such a reversible process is asymmetrically modulated, it must be represented by two different processes in a Process Description. Figure 4.45 illustrates the use of two *process* nodes to represent the reversible activation of a G-protein coupled receptor. In the absence of any effector, an equilibrium exists between the inactive and active forms. The agonist stabilises the active form, while the inverse agonist stabilises the inactive form. 15

The example in Figure 4.46 presents the conversion of two galactoses into a lactose. Galactoses are represented by only one *simple chemical*, the cardinality being carried by the *consumption* arc. 20

²²Undefined previously, but if we define it then it should be visible.

Figure 4.43: Translocation of calcium ion out of the endoplasmic reticulum. Note that the *process* does not have to be located on the boundary of the *compartment*. A *process* is not attached to any *compartment*.

Figure 4.44: Reversible opening and closing of an ionic channel.

Figure 4.45: The reversible activation of a G-protein coupled receptor.

Glyph: Omitted process

SBO Term: SBO:0000397 - omitted process.

Node: An *omitted process* is represented by a *process* in which the square box contains a two parallel slanted lines oriented northwest-to-southeast and separated by an empty space.

Glyph: Uncertain process

SBO Term: SBO:0000396 ! uncertain process.

Node: An *uncertain process* is represented by a *process* which square box contains a question mark.

Glyph: Association

SBO Term: SBO:0000177 ! non-covalent binding.

Node: An *association* between several entities is represented by a filled disc linked to two connectors, small arcs attached on point separated by 180 degrees. The consumption (Section 4.5.34) and production (Section 4.5.34) arcs are linked to the extremities of those connectors.

Figure 4.46: Conversion of two galactoses into a lactose.

Figure 4.47: The Process Description glyph for *omitted process*.Figure 4.48: The Process Description glyph for an *uncertain process*.Figure 4.49: The Process Description glyph for *association*.

The example in Figure 4.50 illustrates the association of cyclin and CDC2 kinase into the Maturation Promoting Factor.

Figure 4.50: Association of cyclin and CDC2 kinase into the Maturation Promoting Factor.

Figure 4.51 gives an example illustrating the association of a pentameric macromolecule (a nicotinic acetylcholine receptor) with a simple chemical (the local anesthetic chlorpromazin) in an unnamed complex.

5

Glyph: *Dissociation*

SBO Term: SBO:0000180 ! dissociation.

Note: A *dissociation* between several entities is represented by two concentric circles. A simple empty disc could be, in some cases, confused with the *catalysis* (section Section 4.5.35). Moreover, the existence of two circles reminds the dissociation, by contrast with the filled disc of the *association* (Section 4.5.26).

10

The example in Figure 4.53 illustrates the dissociation of the small and large ribosomal subunits from a messenger RNA.

Changes from Previous Version

Although the `NonStoichiometricProcess` was not explicitly defined in the previous version the semantics and glyphs are unchanged.

15

Figure 4.51: The association of a pentameric macromolecule with a simple chemical in an unnamed complex.

Figure 4.52: The Process Description glyph for *dissociation*.

Figure 4.53: Dissociation of the small and large ribosomal subunits from a messenger RNA.

4.5.27 Compartment

The Compartment is a logical or physical structure that contains entity pool nodes. An Entity-PoolNode (see section 4.5.10) can only belong to one compartment. Therefore, the “same” biochemical species located in two different compartments are in fact two different pools.

Figure 4.54: The UML definition of the Compartment showing how it containment of Entity-PoolNode.

Generalisation

- SBGNGlyph (see section 4.5.4)

Attributes

name: string (**R**) The name of the compartment.

natures: cv(*) A set of controlled vocabularies²³ that describes a characteristic of the compartment. Zero, one or more values may be set, but each one must belong to a different controlled vocabulary.

Associations

epns:EntityPoolNode (*) The EntityPoolNodes contained by this compartment.

Unique Key

- owning_map
- name

Rules and Constraints

PD53 The process must be irreversible.

PD54 epns must contain a unique set of EntityPoolNodes. See section 4.7 for the definition of EntityPoolNode uniqueness.

Notation

Glyph: *Compartment*

SBO Term: SBO:0000290 ! physical compartment

Container: A compartment is represented by a surface enclosed in a continuous border or located between continuous borders. These borders should be noticeably thicker than the borders of the EPNs. A compartment can take **any** geometry. A compartment must always be entirely enclosed.

Label: The identification of the compartment is carried by an unbordered box containing a string of characters. The characters can be distributed on several lines to improve readability, although this is not mandatory. The label box can be attached anywhere in the container box. Note that the label can spill-over from the container box.

To allow more aesthetically pleasing and understandable maps, compartments are allowed to overlap each other visually, but it must be kept in mind that this does not mean the top compartment contains part of the bottom compartment. Figure 4.56 shows two semantically equivalent placement of compartments:

Overlapped (hidden) part of the compartment should not contain any object which could be covered by an overlapping compartment. Figure 4.57 illustrates the problem using an incorrect map.

²³This reconciles the use of the Unit of Information to represent the nature of an EPN by using to present similar information for the compartment. This is consistent with previous usage, but not with the usage of the Uofl for annotation.

Figure 4.55: The Process Description glyph for *compartment*.

Figure 4.56: Overlapped compartments are permitted, but the overlap does not imply containment.

Figure 4.57: Example of an **incorrect** map. Overlapped compartments must not obscure other objects.

Changes from Previous Version

The use Compartment has a set of natures, which previously were less well specified and handled as notation provided by the *unit of information*. In some cases, where the CVs used are not distinct or if the *unit of information* contains arbitrary text as annotation then maps containing these features will be invalid according to the current specification.

5

4.5.28 AttributeValue

The `AttributeValue`²⁴ is used to present the values of certain attributes held by other SBGN elements. It is typically contained and owned by the class containing the attribute (or its descendants). It contains two values, one is a `code` to indicate the attribute that is defined and the other is the `value` itself. The `code` and the presentation format of the `value` are defined by the SBGN ele-

10

²⁴A new concept, that modifies the behaviour of the Unit of Information in previous versions with the need to use it to present the nature and cardinality of an EPN. The glyph retains its original name, but the class has been names to reflect it purpose.

Figure 4.58: The UML definition of the AttributeValue and its usage by other classes.

ment that contains the AttributeValue, currently Compartment (see section 4.5.27), EntityPoolNode (see section 4.5.10), and Subunit (see section 4.5.20).

Generalisation

- AuxiliaryUnit (see section 4.5.5)

Attributes

code: string (**R**) The code indicating the attribute that is being presented.

value: object (**R**) The value of the attribute. The format of the value is determined by the class holding the attribute.

Associations

No additional associations.

Rules and Constraints

No additional rules and constraints.

Notation

For historical reasons the AttributeValue is represented graphically by the glyph *Unit of Information*.

Glyph: Unit of information When representing biological entities, it is often necessary to convey some abstract information about the entity's function that cannot (or does not need to) be easily related to its structure. The *unit of information* is a decoration that can be used in this situation to add information to a glyph. Some example uses include: characterizing a logical part of an entity such as a functional domain (a binding domain, a catalytic site, a promoter, etc.), or the information encoded in the entity (an exon, an open reading frame, etc.). A *unit of information* can also convey information about the physical environment, or the specific type of biological entity it is decorating.

SBO Term: Not applicable.

Container: A unit of information is represented by a rectangle. The long side of the rectangle should be oriented parallel to the border of the EPN being annotated by the *unit of information*. The center of the bounding box of a *state of information* should be located on the mid-line of the border of the EPN.

Label: A *unit of information* is identified by a label placed in an unbordered box containing a string of characters. The characters can be distributed on several lines to improve readability, although this is not mandatory. The label box must be attached to the center of the container. The label may spill outside of the container.

Figure 4.59: The Process Description glyph for *unit of information*. (a) The glyph. (b) An example of its usage with a *macromolecule*.

Changes from Previous Version

5

There was no definition of the `AttributeValue` in the previous version of this specification. However, the *Unit of Information* did exist although its semantics have been changed. It no longer can hold arbitrary annotation but must display an attribute value and observe the constraints set out by the definition of the class owning the attribute.

Since the use of the *Unit of Information* has been deprecated, it is recommended that `Annotation` (see section 4.5.30) and the *Annotation* glyph is used instead.

10

4.5.29 StateVariable

Many biological entities such as molecules can exist in different *states*, meaning different physical or informational configurations. These states can arise for a variety of reasons. For example, macromolecules can be subject to post-synthesis modifications, wherein residues of the macromolecules (amino acids, nucleosides, or glucid residues) are modified through covalent linkage to other chemicals. Other examples of states are alternative conformations as in the closed/open/desensitized conformations of a transmembrane channel, and the active/inactive forms of an enzyme.

15

In the Process Description language these states are defined by the `StateVariableDefinitions` associated with the `EntityType`, but the specific values of the variables are defined by the `StateVariable` (figure 4.60) associated with the `EntityPoolNode`. For every `StateVariableDefinition` associated with an `EntityType` there should be a corresponding `StateVariable` associated with the instance of `EntityPoolNode` using that type. This enforces one of the fundamental rules of the language that once a state variable has been displayed for a given entity type, then it must always be displayed.

25

Generalisation

- `AuxiliaryUnit` (see section 4.5.5)

Figure 4.60: The UML definition of the `StateVariable` showing its relationship to `StatefulEPN` and `StateVariableDefinition`.

Attributes

value: string (R) The value of the state variable. This is optional, but cannot be an empty string, should start with a non-space character and end with a non-space character. It should also not include the '@' character²⁵.

Associations

owning_epn:StatefulEPN (1) The stateful EPN that owns the state variable.

definition:StateVariableDefinition (1) The definition of this state variable²⁶.

Rules and Constraints

No additional rules and constraints.

Notation

Glyph: *State variable*

SBO Term: Not applicable.

Container: A *state variable* is represented by a “stadium” container, that is two hemicircles of same radius joined by parallel segments, as shown in Figure 4.61. The parallel segment axis should be tangent to the border of the glyph of the *EPN* being modified by the *state variable*. The center of the bounding box of a *state variable* should be located on the mid-line of the border of the *EPN*. In previous versions of this specification the *state variable* was represented by an ellipse. This symbols is now **deprecated** in favour of the stadium symbol described above. New Process Description maps should not use the ellipse symbol.

Label: An unbordered box containing a string indicating the contents of the `StateVariable`. The style of labeling of *State Variables* encouraged by SBGN Process Description Level 1 is to combine a prefix representing the value of the variable with a suffix representing the variable's name. Prefix and suffix should be separated by the symbol '@', X@Y thus meaning *value X AT variable Y*. If **name** is undefined then only the value should be displayed and the '@' character omitted. If both the **name** and **value** are undefined then the label should be empty (i.e., an empty string). The label of a *state variable* should, if possible, be displayed

²⁵Not specified in previous spec, but seems essential if we are to avoid ambiguity.

²⁶New concept. It aims to ensure that all state variables are defined in all EPNS of the same type.

within the boundary of the glyph. In earlier versions of the SBGN specification it was permitted to separate the name and value into two unlabelled boxes and display the name box outside the *state variable* glyph. This is now **deprecated** and new Process Description maps should not use this notation.

Figure 4.61: Examples of the Process Description glyph for *state variable*. Included are the older forms of glyph, which are now deprecated.

A *state variable* does not necessarily have to be Boolean-valued. For example, an ion channel can possess several conductance states; a receptor can be inactive, active and desensitized; and so on. As another example, a *state variable* “ubiquitin” could also carry numerical values corresponding to the number of ubiquitin molecules present in the tail. However, in all cases, a *state variable* on an EPN can only take *one* defined value. Further, an EPN’s *state variable* should always be displayed and always set to a value. An “empty” *state variable* is a *state variable* that is set to the value “unset”, it is not a *state variable* with no value. Note that the value “unset” is *not* synonymous to “any value” or “unknown value”.

Changes from Previous Version

The `StateVariable` class was not explicitly defined in previous versions of the specification, however the *state variable* was. Some aspects of its notation have been deprecated and these are detailed above (section 4.5.29).

4.5.30 Annotation

In SBGN Process Description Level 1 there are cases where the language does not capture everything the author wishes to convey. This may be additional experimental detail or descriptions of mechanisms that cannot be described full by the Process Description language. In this case the language provides the **Annotation**. This contains text and is associated with a particular glyph in a map. Importantly, it is purely “decoration” and does alter the meaning the map.

Generalisation

- `AuxiliaryUnit` (see section 4.5.5)

Attributes

`annotation_text`: string (**R**) The text of the annotation. The text is mandatory and cannot be empty or just spaces.

Associations

annotated_glyph:SBGNGlyph (1) The instance of SBGNGlyph that is being annotated²⁷.

Rules and Constraints

No additional rules and constraints.

Notation

5

Glyph: *Annotation*

SBO Term: SBO:0000550 ! annotation

Container: An *annotation* is represented by a rectangular container with a folded corner, as illustrated in Figure 4.62. This container is linked to the annotated element via a callout (see figure 4.63. The callout should overlap with the object it is annotating.

10

Label: An *annotation* contains information placed in an unbordered box containing a string of characters. The characters can be distributed on several lines to improve readability, although this is not mandatory. The label box must be attached to the center of the container. The label may spill outside of the container.

Figure 4.62: The Process Description glyph for *annotation*.

Figure 4.63: Example of *annotations* adding information to the description of the transphosphorylation of CaMKII. Note that three different types of links are used between annotation nodes and annotated elements. However, it is recommended to use a consistent scheme within a map.

Changes from Previous Version

15

This is a new language element and an not previous versions of the Process Description language.

Figure 4.64: The UML definition of the **Crossreference** showing its subclasses **Tag** and **SubmapTerminal** and its association with other elements in the Process Description language.

4.5.31 CrossReference

CrossReference²⁸ handles links or relationships between elements of a map and submap. At present there is only one reference glyph, *tag*, which can be used in a map referred to by a *submap* (Section 4.5.24) or as an auxiliary unit on the *submap*. The *clone marker* can also provide additional reference mechanisms and is discussed below (Section 4.5.38).

5

Generalisation

None

Attributes

reference_id: string (R) a string that identifies the cross-reference. The string cannot start and end in white space and cannot be empty.

10

Associations

equivalence:EquivalenceArc (1) The equivalence arc that links this class to the referenced element.

Rules and Constraints

PD55 Two or more instances of **CrossReference** with the same **reference_id** value are pointing to the same element.

15

Changes from Previous Version

Not defined in the previous version.

4.5.32 SubmapTerminal

A SubmapTerminal²⁹ (figure 4.30) is a named reference that is part of a Submap (see section 4.5.24). It provides the reference that is the link to a tag in the submap that the Submap refers to.

Generalisation

- AuxiliaryUnit (see section 4.5.5)
- CrossReference (see section 4.5.31)

5

Attributes

No additional attributes.

Associations

No additional associations.

10

Rules and Constraints

No additional rules and constraints.

Notation

Glyph: *Submap Terminal*

SBO Term: Not applicable.

15

Container: A *tag* is represented by a rectangle fused to an empty arrowhead. The flat edge opposite the arrowhead should be aligned to the edge of the *Submap* glyph and the connecting should connect to the middle of this face (see figure 4.65).

Label: A *tag* is identified by a label placed in an unbordered box containing a string of characters. The characters can be distributed on several lines to improve readability, although this is not mandatory. The label box must be attached to the center of the container. The label may spill outside of the container.

20

Figure 4.65: The Process Description glyph for *Submap Terminal*. This shows the basic glyph and its correct usage within a *Submap* glyph.

²⁷Note that as a result of this association only glyphs and **not** auxiliary items may be annotated by instances of Annotation

²⁸A new concept required for consistency between tags and submap terminals.

²⁹Not properly defined in previous versions of the spec. The rules described here are consistent with accepted usage.

Changes from Previous Version

Clarified that the tag does not link a Compartment, but only instances of EntityPoolNode.

4.5.33 Tag

A Tag is a named handle, or reference, to another EntityPoolNode. *Tags* are used to identify those elements in *submaps* (Section 4.5.24).

5

Generalisation

- SBGNGlyph (see section 4.5.4)
- CrossReference (see section 4.5.31)

Attributes

No additional attributes.

10

Associations

No additional associations.

Rules and Constraints

PD56 All values of `reference_id` must be unique within an instance of Map.

Notation

15

Glyph: *Tag*

SBO Term: Not applicable.

Container: A *tag* is represented by a rectangle fused to an empty arrowhead, as illustrated in Figure 4.66. The symbol should be linked to one and only one edge (i.e., it should reference only one EPN or compartment).

20

Label: A *tag* is identified by a label placed in an unbordered box containing a string of characters. The characters can be distributed on several lines to improve readability, although this is not mandatory. The label box must be attached to the center of the container. The label may spill outside of the container.

Figure 4.66: The Process Description glyph for *tag*.

Changes from Previous Version

25

Clarified that the tag does not link a Compartment, but only instances of EntityPoolNode.

Figure 4.67: The UML definition of the FluxArc and its subclasses.

4.5.34 FluxArc

The FluxArc permits a quantity of entities to flow through the arc and in doing so connects a stoichiometric process (StoichiometricProcess (see section 4.5.26)) and an EPN (EntityPoolNode (see section 4.5.10)). The FluxArc has a stoichiometry which is used to indicate the stoichiometry of a process. It is required to eliminate ambiguity when the exact composition, or the number of copies, of the inputs or outputs to a reaction are ambiguous from the map (see figure 4.71 for an example). The FluxArc has three forms determined by its flux_type:

consumption Links an entity pool to a process that will consumed it (an input to the process).

production Links an entity pool to a process that will be produced by a process (an output from the process). It may also links entities on the “right-hand-side” of a reversible process (see section 4.5.26 for more details about the reversible process).

reversible Links a process to an entity pool that is the “left-hand-side” of a process (see section 4.5.26).

Generalisation

- SBGNArc (see section 4.5.7)

Attributes

stoichiometry: int (R) The stoichiometry of this FluxArc (see section 4.5.34). This must be a non-zero positive integer. **flux_type: enumR** The type of the flux arc. One of the following: consumption, production and reversible.

No additional attributes.

Associations

No additional associations.

Rules and Constraints

PD57 if the stoichiometry is not displayed then it is assumed to be 1³⁰

PD58 If the stoichiometry > 1 then the stoichiometry must be displayed.³¹

PD59 if flux_type = 'consumption' or 'reversible' then:

- The in_node must be an instance of EntityPoolNode (see section 4.5.10).
- The out_node must be an instance of StoichiometricProcess (see section 4.5.26).

PD60 if flux_type = 'production' then:

- The in_node must be an instance of StoichiometricProcess (see section 4.5.26).
- The out_node must be an instance of EntityPoolNode (see section 4.5.10).

Notation

The FluxArc is represented by three glyphs depending on its flux_type:

consumption *consumption arc*.

production *production arc*.

reversible *reversible arc*³².

These are defined below. In addition the stoichiometry is displayed by the *stoichiometry label*. Its appearance and layout in relation to the flux arc is also described here.

Glyph: Consumption

SBO Term: SBO:0000394 ! consumption.

End point: No particular symbol is used to represent a consumption.

Figure 4.68: The Process Description glyph for *consumption*.

Glyph: Production

SBO Term: SBO:0000393 ! production.

End point: The target extremity of a *production* carries a filled arrowhead.

Glyph: Reversible

SBO Term: SBO:0000393 ! production.

End point: The origin extremity of a *reversible* carries a filled arrowhead.

³⁰The previous version said that the stoichiometry was unspecified, but this was before the stoichiometric process was specified. In addition since cardinality is defined explicitly the stoichiometry can often be implied.

³¹See above comment.

³²The reversible arc is introduced here to fix syntax problems in previous spec. The change is visually neutral on previous Process Description maps.

Figure 4.69: The Process Description glyph for *production*.Figure 4.70: The Process Description glyph for *reversible*.

Glyph: Stoichiometry Label The stoichiometry label is part of the *consumption arc* and *production arc* glyphs see below (sections 4.5.34 and 4.5.34). However, as their use is common to all subclasses of FluxArc their presentation is described here.

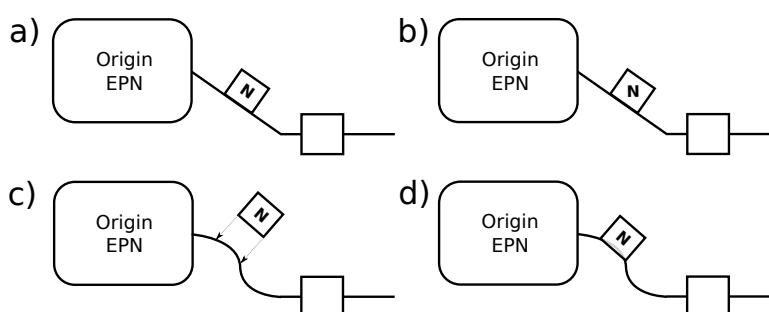

Figure 4.71: Examples of stoichiometry label layout. In figure (a) the label is aligned with the stoichiometry box, while in (b) the label is aligned with the orientation of the map: these are both simple cases where the arc is a straight line. In cases where the arc is curved, the corners at the base of the label are anchored to point on the arc (c) and the label is drawn over the arc (d). Note that in (d) the covered part of the arc is shown for clarity, but normally the box is opaque and so the arc is not visible.

The label is a node that must be drawn above the flux arc. This node is attached to the arc where it intersects the arc with its bottom corners (see figure 4.71.)³³.

SBO Term: Not Applicable

Container: A rectangle with a draw edge.

Label: A number that should remain within the container and be of a normal font, i.e., not bold or italic.

Changes from Previous Version

The *reversible arc* has been added to ensure the correct syntax is observed for a reversible process³⁴ — using the *production arc* for this was syntactically forbidden in the previous version of the specification. There is no change to semantics from previous version, but layout rules for placement of stoichiometry label have been clarified.

Figure 4.72: The UML definition of the `ModulationArc`. The class interacts with subclasses of `StoichiometricProcess`.

4.5.35 ModulationArc

The `ModulationArc` (figure 4.72) affects the flux of a process represented by the target process. Such a modulation can affect the process **positively or negatively**, or even both ways depending on the conditions, for instance the concentration of the intervening participants. The permitted values for `process_type` are described in the following table:

5

modulation	A general modulation where the exact nature of the modulation is not specified or not known. Modulation can be used when one does not know the precise direction of the effect.
stimulation	A stimulation affects positively the flux of a process represented by the target process. This stimulation can be for instance a catalysis or a positive allosteric regulation. Note that <i>catalysis</i> exists independently in SBGN, see Section 4.5.35.
catalysis	A particular case of stimulation, where the effector affects positively the flux of a process represented by the target process. The positive effect on the process is due to the lowering of the activation energy of a reaction.
inhibition	An inhibition negatively affects the flux of a process represented by the target process. This inhibition can be for instance a competitive inhibition or an allosteric inhibition.
necessary_stim	A necessary stimulation, is one that is necessary for a process to take place. A process modulated by a necessary stimulation can only occur when this necessary stimulation is active.

As discussed in Chapter 2, it is implied, but not defined explicitly that the process has a rate at which it converts its LHS EPNs to its RHS EPNs (and vice-versa in the case of a reversible process). This concept is important in understanding how the Process Description language describes process modulation³⁵.

10

See
footnote.

1. A *process* with no modulations has an underlying “basal rate” which describes the rate at which it converts inputs to outputs.

³³These layout rules were agreed at COMBINE 2010, but have not been voted on.

³⁴New glyph. We need it to ensure the correct syntax as we have a directed graph and we need to prevent the production arc pointing towards the process. It looks the same as the previous situation.

³⁵This is taken from the grammar section of the previous specification.

2. A *modulation* changes the basal rate in an unspecified fashion.
3. A *stimulation* is a modulation that increases the basal rate.
4. An *inhibition* is a modulation that decreases the basal rate.
5. The above types of modulation, when assigned to the same process, are combined and have a multiplicative effect on the basal rate of the process.
6. Modulators that do not interact with each other in the above manner, should be drawn as modulating different process nodes. Their effect is therefore additive.

5

Generalisation

- EntityPoolNode (see section 4.5.10)

Attributes

10

No additional attributes.

Associations

states:StateVariable (*) The state variables associated with this EPN.

Rules and Constraints

PD61 At most one *necessary stimulation* can be assigned to a process node. Two *necessary stimulations* would imply an implicit AND or OR operator. For clarity only one *necessary stimulation* can be assigned to a *process*, and such combinations must be explicitly expressed using *logical operators*³⁶.

15

PD62 At most one *catalysis* can be assigned to a *process*. Modulation by a catalysis arc implies that the exact biochemical mechanism underlying the process is known. In this context two *catalysis* cannot be assigned to the same process node as they represent independent reactions. Other EPNs can be assigned to the same process as a catalysis, such as modulators, stimulators, and inhibitors, and will have a multiplicative modulation on the reaction rate defined by the catalysis³⁷.

20

Notation

25

The ModulationArc is represented by a number of glyphs depending on its *modulation_type*. The table below defines what glyph is used for each type.

Type	Glyph
modulation	<i>Modulation</i>
stimulation	<i>Stimulation</i>
catalysis	<i>Catalysis</i>
inhibition	<i>Inhibition</i>
necessary_stim	<i>Necessary Stimulation</i>

³⁶Taken from the grammar section of the previous specification.

³⁷Taken from the grammar section of the previous specification.

Glyph: Modulation**SBO Term:** SBO:0000168 ! control.**End point:** The target extremity of a *modulation* carries an empty diamond.Figure 4.73: The Process Description glyph for *modulation*.

Figure 4.74 represents the effect of nicotine on the process between closed and open states of a nicotinic acetylcholine receptor. High concentrations of nicotine open the receptor while low concentrations can desensitize it without opening. 5

Figure 4.74: Modulation of nicotinic receptor opening by nicotine.

Glyph: Stimulation**SBO Term:** SBO:0000170 ! stimulation.**End point:** The target extremity of a *stimulation* carries an empty arrowhead.Figure 4.75: The Process Description glyph for *stimulation*.**Glyph: Catalysis****SBO Term:** SBO:0000172 ! catalysis.**Node:** The target extremity of a *catalysis* carries an empty circle.Figure 4.76: The Process Description glyph for *catalysis*.

Glyph: Inhibition**SBO Term:** SBO:0000169 ! inhibition.**Node:** The target extremity of an *inhibition* carries a bar perpendicular to the arc.Figure 4.77: The Process Description glyph for *inhibition*.**Glyph: Necessary stimulation****SBO Term:** SBO:0000171 ! necessary stimulation.**Node:** The target extremity of a *necessary stimulation* carries an open arrow (to remind that it is a *stimulation*) coming after a larger vertical bar.Figure 4.78: The Process Description glyph for *Necessary Stimulation*.

Examples The example in Figure 4.79 below describes the transcription of a gene X, that is the creation of a messenger RNA X triggered by the gene X. The creation of the protein X is then triggered by the mRNA X. (Note that the same example could be represented using the gene as reactant and product, although it is semantically different.)

Figure 4.79: The creation of a messenger RNA X triggered by the gene X.

The example in Figure 4.80 below describes the transport of calcium ions out of the endoplasmic reticulum. Without IP3 receptor, there is not calcium flux, therefore, one cannot use a *stimulation*. The Necessary Stimulation instead represents this absolute stimulation.

Changes from Previous Version

The definition of `ModulationArc` did not exist in the previous version but there has been no changes to the glyphs and glyph semantics in this version.

Figure 4.80: The transport of calcium ions out of the endoplasmic reticulum into the cytosol. Note that IP3R crosses both compartment boundaries. This is allowed, but the Macromolecule should only belong to one of the compartments see section D.1 for more discussion of this issue.

4.5.36 LogicArc

The LogicArc (figure 4.81) takes a quantity from either a LogicalOperator (see section 4.5.25) or an EntityPoolNode (see section 4.5.10) and converts it into a Boolean output, which serves as an input for a LogicalOperator (see section 4.5.25). How this is done is not defined, but one could imagine that when a threshold value of the quantity is exceeded the output is True.

5

Figure 4.81: The UML definition of the LogicArc and its context.

Generalisation

- SBGNArc (see section 4.5.7)

Attributes

No additional attributes.

Associations

No additional associations.

10

Rules and Constraints

PD63 The `in_node` must be an instance of EntityPoolNode or LogicalOperator.

PD64 The `out_node` must be an instance of LogicalOperator.

Notation

Glyph: *Logic arc* *Logic arc* is used to represent the fact that an entity influences the outcome of a logic operator.

SBO Term: SBO:0000398 ! logical relationship.

End point: No particular symbol is used to represent a logic arc.

5

Figure 4.82: The Process Description glyph for *logic arc*.

Changes from Previous Version

No changes from the previous version.

4.5.37 EquivalenceArc

Figure 4.83: The UML definition of the **EquivalenceArc** and its context.

EquivalenceArc (figure 4.83) is the arc used to link a cross-reference to an **EntityPoolNode** (see section 4.5.10) in another Process Description map (represented by **CrossReference** (see section 4.5.31)) with an **EntityPoolNode** (see section 4.5.10) in this map. 10

Generalisation

- **SBGNGlyph** (see section 4.5.4)

Attributes

No additional attributes.

15

Associations

`cross_ref:CrossReference` (1) The cross reference associated to be associated with an EPN by this class.

`ref_epn:EntityPoolNode` (1) The EPN that the cross-reference refers to.

Rules and Constraints

No additional rules and constraints.

Notation

Glyph: *Equivalence arc*

SBO Term: Not applicable.

End point: No particular symbol is used to represent an *equivalence arc*.

Figure 4.84: The Process Description glyph for *Equivalence arc*.

Changes from Previous Version

The relationship of `EquivalenceArc` to the `SubmapTerminal` (see section 4.5.32) was unclear in previous versions of the specification and has been clarified here.

4.5.38 CloneMarker

Figure 4.85: The UML definition of the `StateVariable` showing its relationship to `StatefulEPN`, `Complex` and `Subunit`.

If an `EntityPoolNode` (see section 4.5.10) is duplicated on a map, it is necessary to indicate this fact by the `CloneMarker` auxiliary unit (figure 4.85). The purpose of this marker is to provide the reader with a visual indication that this node has been cloned, and that at least one other occurrence of the `EntityPoolNode` can be found in the map (or in a submap; see Section 4.5.24). The clone marker takes two forms, simple and labeled, depending on whether the node being cloned can carry state variables (i.e., whether it is a stateful EPN). Note that an `EntityPoolNode` belongs to a single compartment. If two classes named “X” are located in two different compartments,

such as ATP in cytosol and ATP in mitochondrial lumen, they represent different Entity Pools, and therefore do not need to be marked as cloned.

Generalisation

- AuxiliaryUnit (see section 4.5.5)

Attributes

5

No additional attributes.

Associations

owning_epn:EntityPoolNode (1) The EPN that holds this clone marker.

Rules and Constraints

No additional rules and constraints.

10

Changes from Previous Version

Not defined in previous version.

4.5.39 SimpleCloneMarker

The SimpleCloneMarker (figure 4.85) is the unlabelled subclass CloneMarker. All duplicated instances of StatelessEPN must contain an instance of this class.

15

Generalisation

- CloneMarker (see section 4.5.38)

Attributes

No additional attributes.

Associations

20

No additional associations.

Rules and Constraints

PD65 Only subclasses of StatelessEPN (see section 4.5.12) can contain SimpleCloneMarkers.

Notation

Simple clone marker

25

SBO Term: Not applicable.

Container: The simple (unlabeled) *clone marker* is a portion of the surface of an *EPN* that has been modified visually through the use of a different shade, texture, or color. Figure 4.86 illustrates this. The *clone marker* occupies the lower part of the *EPN*. The filled area must be smaller than the unfilled one.

30

Figure 4.86: The Process Description glyph for *simple clone marker* applied to a *simple chemical* and a *multimer of simple chemicals*.

Label: Not applicable.

Figure 4.87 contains an example in which we illustrate the use of *clone markers* to clone the species ATP and ADP participating in different reactions. This example also demonstrates the chief drawbacks of using clones: it leads to a kind of dissociation of the overall network and multiplies the number of nodes required, requiring more work on the part of the reader to interpret the result. Sometimes these disadvantages are offset in larger maps by a reduction in the overall number of line crossings, but not always. In general, we advise that cloning should be used sparingly.

Figure 4.87: An example of using cloning, here for the species ATP and ADP.

Changes from Previous Version

No change from previous version.

4.5.40 LabelledClonerMarker

Unlike the class `SimpleCloneMarker`, the `LabeledCloneMarker` (figure 4.85) includes (unsurprisingly, given its name) an identifying label that can be used to identify equivalent clones elsewhere in the map. This is particularly useful for subclasses of `StatefulEPN` (see section 4.5.16), because these can have a large number of state variables displayed and therefore may be difficult to visually identify as being identical.

Generalisation

- `CloneMarker` (see section 4.5.38)

Attributes

label: string (**R**) The label that identified the clone. This label must start and end with an alphanumeric character, and cannot contain white space.

Associations

No additional associations.

5

Rules and Constraints

PD66 At least two or more instanced of a `LabelledCloneMarker` with the same label must exist in this same in a given `Map` (see section 4.5.3).

PD67 Only subclasses of `StatefulEPN` (see section 4.5.16) can contain labelled clone markers.

Notation

10

Labeled clone marker

SBO Term: Not applicable.

Container: The labeled *clone marker* is a portion of the surface of an *EPN* that has been modified visually through the use of a different shade, texture, or color. The *clone marker* occupies the lower part of the EPN glyph. The filled area must be smaller than the unfilled one, but the be 15
large enough to have a height larger than the *clone marker's* label (cf below).

Label: A *clone marker* is identified by a label placed in an unbordered box containing a string of characters. The characters can be distributed on several lines to improve readability, although this is not mandatory. The label box must be attached to the center of the container. The label may spill outside of the container (the portion of the surface of the EPN that has 20
been modified visually). The font color of the label and the color of the clone marker should contrast with one another. The label on a *labeled clone marker* is mandatory.

Figure 4.88: The Process Description glyph for *labeled clone marker* applied to a *macromolecule*, a *nucleic acid feature* and a *multimer of macromolecules*.

Changes from Previous Version

No changes from previous version.

4.6 Controlled vocabularies

25

Some classes in the SBGN Process Description language can contain particular kinds of textual annotation conveying information relevant to the class. Examples are the natures of an `EntityPoolNode` (see section 4.5.10) or `Compartment` (see section 4.5.27) or the value of the `StateVariable` (see section 4.5.29). The values held by these attributes can be taken from controlled vocabu- 30
laries defined below. When displayed in some cases it is mandatory to prefix a code indicating the

type of controlled vocabulary used. This is in order to make it clear what the information is that the value refers to: for example 'mt' indicates that a value 'rna' is describing the material RNA.

In the rest of this section, we describe the controlled vocabularies (CVs) used in SBGN Process Description Level 1. They cover the following categories of information: an EPN's material type, an EPN's conceptual type, covalent modifications on macromolecules and the physical characteristics. These controlled vocabularies are *closed* in the sense that only the values defined for each CV can be used in a valid Process Description map and also closed because only the controlled vocabularies defined in this specification can be used in a valid Process Description map³⁸. We understand that this is of necessity restrictive, but in closing these definitions it means we can be clear about the meaning of all CV terms used in the specification. Updates to the CV terms and the CVs used are welcome and we encourage any changes or additions to be submitted as a tracker item at the address given on the front page of this specification.

4.6.1 Entity pool node material types

The material type of an EPN indicates its chemical structure. A list of common material types is shown in Table 4.1, but others are possible. The values are to be taken from the Systems Biology Ontology (<http://www.ebi.ac.uk/sbo/>), specifically from the branch having identifier SBO:0000240 (*material entity* under *physical entity representation*). The labels are defined by SBGN Process Description Level 1.

Name	Label	SBO term
Non-macromolecular ion	mt:ion	SBO:0000327
Non-macromolecular radical	mt:rad	SBO:0000328
Ribonucleic acid	mt:rna	SBO:0000250
Deoxyribonucleic acid	mt:dna	SBO:0000251
Protein	mt:prot	SBO:0000297
Polysaccharide	mt:psac	SBO:0000249

Table 4.1: A sample of values from the *material types* controlled vocabulary (Section 4.6.1).

The material types are in contrast to the *conceptual types* (see below). The distinction is that material types are about physical composition, while conceptual types are about roles. For example, a strand of RNA is a physical artefact, but its use as messenger RNA is a role.

4.6.2 Entity pool node conceptual types

An EPN's *conceptual type* indicates its function within the context of a given Process Description. A list of common conceptual types is shown in Table 4.2, but others are possible. The values are to be taken from the Systems Biology Ontology (<http://www.ebi.ac.uk/sbo/>), specifically from the branch having identifier SBO:0000241 (*functional entity* under *physical entity representation*). The labels are defined by SBGN Process Description Level 1.

4.6.3 Macromolecule covalent modifications

A common reason for the introduction of state variables (Section 4.5.29) on an entity is to allow access to the configuration of possible covalent modification sites on that entity. For in-

³⁸The previous version was a bit vague but implied that the CVs were open. This has been changed after discussion on the list.

Name	Label	SBO term
Gene	ct:gene	SBO:0000243
Transcription start site	ct:tss	SBO:0000329
Gene coding region	ct:coding	SBO:0000335
Gene regulatory region	ct:grr	SBO:0000369
Messenger RNA	ct:mRNA	SBO:0000278

Table 4.2: A sample of values from the *conceptual types* vocabulary (Section 4.6.2).

stance, a macromolecule may have one or more sites where a phosphate group may be attached; this change in the site's configuration (i.e., being either phosphorylated or not) may factor into whether, and how, the entity can participate in different processes. Being able to describe such modifications in a consistent fashion is the motivation for the existence of SBGN's covalent modifications controlled vocabulary.

Table 4.3 lists a number of common types of covalent modifications. The most common values are defined by the Systems Biology Ontology in the branch having identifier SBO:0000210 (*addition of a chemical group* under *interaction*→*process*→*biochemical* or *transport reaction*→*biochemical reaction*→*conversion*). The labels shown in Table 4.3 are defined by SBGN Process Description Level 1; for all other kinds of modifications not listed here, the author of a Process Description must create a new label (and should also describe the meaning of the label in a legend or text accompanying the map).

Name	Label	SBO term
Acetylation	Ac	SBO:0000215
Glycosylation	G	SBO:0000217
Hydroxylation	OH	SBO:0000233
Methylation	Me	SBO:0000214
Myristoylation	My	SBO:0000219
Palmytoylation	Pa	SBO:0000218
Phosphorylation	P	SBO:0000216
Prenylation	Pr	SBO:0000221
Protonation	H	SBO:0000212
Sulfation	S	SBO:0000220
Ubiquitination	Ub	SBO:0000224

Table 4.3: A sample of values from the *covalent modifications* vocabulary (Section 4.6.3).

4.6.4 Physical characteristics

SBGN Process Description Level 1 defines a special unit of information for describing certain common physical characteristics. Table 4.4 lists the particular values defined by SBGN Process Description Level 1.

Name	Label	SBO term
Temperature	pc:T	SBO:0000147
Voltage	pc:V	SBO:0000259
pH	pc:pH	SBO:0000304

Table 4.4: A sample of values from the *physical characteristics* vocabulary (Section 4.6.4).

4.7 Uniqueness and Cloning

By definition all glyphs drawn on a Process Description language are unique. They are shapes that are distinct from other shapes drawn on the map. However, in some cases the glyphs can represent the same concepts. The Process Description language has a number of rules that rely on and understanding when two glyphs are the same concept. For example there is a rule that two or more macromolecules in the same compartment must be decorated with a *Clone Marker*, and another rule that a compartment cannot be duplicated in a Process Description map. To distinguish between the uniqueness of the glyph and its underlying concept we use the concept of “logical identity”. Each glyph has a “logical key” that uniquely identifies it. In the element definitions above this is described in the *Unique Key* section.

The Unique key defines the attributes of the class that uniquely define it. So, for example, a compartment it is uniquely defined by a combination of its owning map and its name (see section 4.5.27). However not all entries have a Unique key defined and for these each glyph drawn on the map and its underlying concept are unique. In other-words both the glyph and its concept have instance identity.

Logical identity is important when understanding when to use the *Simple Clone Marker* and *Labelled Clone Marker*. A clone marker must be applied when type glyphs of type *EntityPoolNode* is logically identical on a map. In effect this rule means that glyphs representing the same entity pools are highlighted, allowing the reader to easily identify that equivalence. Clone marker usage is illustrated in figure 4.89.

4.7.1 Compartment spanning

An *EPN* cannot *belong* to more than one *compartment*. However, an *EPN* can be *drawn* over more than one *compartment*. In such cases, the decision on which is the owning *compartment* is deferred to the drawing tool or the author. A *complex* may contain *EPNs* which belong to different *compartments* and in this way a *complex* can be used to describe entities that span more than one compartment.

This restriction makes it impossible to represent in a semantically correct way a macromolecule that spans more than one compartment — for example a receptor protein. It is clearly desirable to be able to show a macromolecule in a manner that the biologist expects (i.e. spanning from the outside through the membrane to the inside). Therefore, the author is recommended to draw the macromolecule across compartment boundaries, but the underlying SBGN semantic model will assign it to only one. The assignment to a *compartment* may be decided by the software drawing tool or the author. Note that this has implications for auto-layout algorithms as they will only be able to treat such *entity pool nodes* as contained within a *compartment* and will have no way of knowing a macromolecule spans a compartment.

The current solution is consistent with other Systems Biology representations such as SBML and BioPAX. For more information about the problems representing membrane spanning proteins and the rationale behind the current solution see Section D.

Figure 4.89: This fictitious example illustrates the correct cloning semantics in the Process Description language. The diagram shows the association of the phosphorylated macromolecule A (A[P]) and simple chemical B into a complex. Two copies of B are consumed and these are shown as separate subunits in the complex (note that no clone marker is used). The complex then dissociates into the same components that formed it which requires an appropriate clone marker to be applied. A[P] is translocated into compartment 2 where A[P] is not cloned as it does not have a duplicate. The unphosphorylated form of A dimerised, but again this does not require a clone marker as these are regarded as separate entity pools.

Layout Rules for a Process Description

5.1 Introduction

The previous chapters describe the appearance and meaning of SBGN Process Description Level 1 components. Here we describe rules governing the visual appearance and aesthetics of the Process Description language. The components of a Process Description have to be placed in a meaningful way – a random distribution with spaghetti-like connections will most likely hide the information encoded in the underlying model, whereas an elegant placement of the objects, giving a congenial appearance of the maps, may reveal new insights. The arrangement of components in a map is called a *layout*. 5 10

SBGN Process Descriptions should be easily recognisable not only by the glyphs used, but also by the general style of the layout. However, the arrangement of the components is a complex art in itself, and there is no simple rule which can be applied to all cases. Therefore this section provides rules for the layout of process description maps, divided into two categories: 15

1. requirements, i. e. rules which **must** be fulfilled by a layout, and
2. recommendations, i. e. rules which **should** be followed if possible.

In addition, we provide a list of additional suggestions which may help in producing aesthetically more pleasant layouts, possibly easier to understand.

Those layout rules are independent of the method used to produce the map, and apply to both manually drawn maps as well as maps produced by an automatic layout algorithm. The rules do not deal with interactive aspects (e. g. the effect of zooming). Further information about automatic network layout (graph drawing) can be found, for example, in the books of Di Battista and co-authors [5] and Kaufmann and Wagner [6]. 20

Please note that the color of objects do not carry any meaning in SBGN. Although one can use colors to emphasize part of a map or encode additional information, the meaning of the map should not depend on the colors. Furthermore, objects can have different sizes and size is also meaningless in SBGN. For example, a process node may be larger than a EPN node. Also the meaning of a graph should be conserved upon scaling as far as possible. 25

5.2 Requirements

Requirements are rules which **must** be fulfilled by a layout to produce a valid Process Description map. 30

5.2.1 Node-node overlaps

Nodes are only allowed to overlap in two cases when they are allowed to contain other nodes — as described in Chapter 4. Otherwise, nodes are not allowed to overlap (Figure 5.1). This includes the touching of nodes. Touching is not allowed apart from the case where it has a specific meaning, e.g. two macromolecules touching each other within a complex because they form the complex.

5

Figure 5.1: Nodes must not overlap.

5.2.2 Node-edge crossing

Edges must be drawn on the top of a node (Figure 5.2). See also recommendation Section 5.3.1.

Figure 5.2: If an edge crosses a node, the edge must be drawn on top of the node.

5.2.3 Node border-edge overlaps

Edges are not allowed to overlap the border lines of nodes (Figure 5.3).

Figure 5.3: Edges must not overlap node borders.

5.2.4 Edge-edge overlaps

10

Edges are not allowed to overlap (Figure 5.4). This includes touching of edges. Furthermore, an edge is neither allowed to cross itself nor to cross a boundary of a node more than twice or other edges more than once.

5.2.5 Node orientation

Nodes have to be drawn horizontally or vertically, any other rotation of elements is not allowed (Figure 5.5).

15

Figure 5.4: Edges must not overlap.

Figure 5.5: The node orientation must be horizontally or vertically.

5.2.6 Node-edge connection

1. The arcs linking the square glyph of a *process* to the *consumption* and *production arcs* are attached to the center of opposite sides (Figure 5.6).
2. The modulatory arcs are attached to the other two sides, but not necessarily all to the center, as several modifiers can affect the same process node.

5

Figure 5.6: Arcs between a *process* and the *consumption* and *production arcs* must be attached to the center of opposite sides, modulatory arcs must be attached to the other two sides.

5.2.7 Node labels

At least a part of the label (unbordered box containing a string of characters) has to be placed inside the node it belongs to. Node labels are not allowed to overlap other nodes or other labels (this includes touching of other nodes or labels).

5.2.8 Edge labels

10

Edge labels are not allowed to overlap nodes. This includes touching of nodes.

5.2.9 Compartments

If a process has all participants in the same compartment the process node and all edges/arcs should be drawn in this compartment. If a process has participants in at least two different compartments, the process node has to be either in a compartment where the process has at least one participant or in the empty space.

15

5.3 Recommendations

Recommendations are rules which should be followed if possible and generally should improve the clarity of the diagram.

5.3.1 Node-edge crossing

Situations where edges and nodes cross should be avoided. Note that some crossings may be unavoidable, e. g. the crossing between an edge and a compartment border or an edge and a complex. 5

5.3.2 Labels

Labels should be horizontal. Node labels should be placed completely inside the node if possible. Edge labels should be placed close to the edge and avoid overlapping the edge as well as other edge labels. 10

5.3.3 Avoid edge crossings

The amount of crossings between edges should be minimized.

5.3.4 Branching of *association* and *dissociation*

The branching points of *association* and *dissociation* nodes should be placed closed to the symbol of the process, if possible at a distance comparable than, or smaller to, the diameter of the symbol defining the process (Figure 5.7). 15

Figure 5.7: Branching points should be close to association and dissociation symbols.

5.3.5 Units of information

Units of information should not hide the structure of the corresponding node and should not overlap other elements (Figure 5.8).

Figure 5.8: Units of information should not overlap with any other element.

5.4 Additional suggestions

Here is a list of additional layout suggestions which may help improve the aesthetics and clarity of Process Description maps.

- Angle of edge crossings: If edge crossing cannot be avoided then the edges should cross with an angle close to 90 degrees. 5
- Drawing area and width/height ratio: The drawing should be compact and the ratio between the width and the height of the drawing should be close to 1.
- Edge length: Long edges should be avoided.
- Number of edge bends: Edges should be drawn with as few bends as possible.
- Similar and symmetric parts: Similar parts of a map should be drawn in a similar way, and symmetric parts should be drawn symmetrically. 10
- Proximity information: Related elements (e. g. nodes connected by a process or all elements within a compartment) should be drawn close together.
- Directional information: Subsequent processes (e. g. a sequence of reactions) should be drawn in one direction (e. g. from top to bottom or from left to right). 15
- Compartments: It can help clarity to use a different background shade or color for each compartment.

Acknowledgments

Here we acknowledge those people and organisations that assisted in the development of this and previous releases of the SBGN Process Description language specification. First we specifically acknowledge those who contributed directly to each revision of the specification document, followed by a comprehensive acknowledgement of contributors that attended workshops and forum meetings or in some other way provided input to the standard. Finally, we acknowledge the bodies that provided financial support for the development of the standard. 5

6.1 Level 1 Release 1.0 10

The specification was written by Nicolas Le Novère, Stuart Moodie, Anatoly Sorokin, Michael Hucka, Falk Schreiber, Emek Demir, Huaiyu Mi, Yukiko Matsuoka, Katja Wegner, and Hiroaki Kitano. In addition, the specification benefited much from the help of (in alphabetical order) Frank Bergmann, Sarala Dissanayake, Ralph Gauges, Peter Ghazal, Lu Li, and Steven Watterson.

6.2 Level 1 Release 1.1 15

The specification of SBGN PD Level 1 Release 1.1 was written by Stuart Moodie and Nicolas Le Novère, with contributions from (in alphabetical order) Frank Bergmann, Sarah Boyd, Emek Demir, Sarala Wimalaratne, Yukiko Matsuoka, Huaiyu Mi, Falk Schreiber, Anatoly Sorokin, and Alice Villéger.

6.3 Level 1 Release 1.2 20

The specification of SBGN PD Level 1 Release 1.2 was modified by Stuart Moodie, with contributions from (in alphabetical order) Sarah Boyd, Nicolas Le Novère, and Huaiyu Mi.

6.4 Level 1 Release 1.3

The specification of SBGN PD Level 1 Release 1.3 was modified by Stuart Moodie, with contributions from (in alphabetical order), Tobias Czauderna, Nicolas Le Novère, and Anatoly Sorokin. 25

6.5 Level 1 Release 2.0

The specification of SBGN PD Level 1 Release 2.0 was modified by Stuart Moodie, with contributions from (in alphabetical order), Tobias Czauderna, Nicolas Le Novère, Huaiyu Mi, Falk Schreiber, Anatoly Sorokin and Alice Villéger.

6.6 Comprehensive list of acknowledgements

5

Here is a more comprehensive list of people who have been actively involved in SBGN development, either by their help designing the languages, their comments on the specification, help with development infrastructure or any other useful input. We intend this list to be complete. We are very sorry if we forgot someone, and would be grateful if you could notify us of any omission.

Mirit Aladjem, Frank Bergmann, Michael Blinov, Bernard de Bono, Sarah Boyd, Laurence Calzone, Melanie Courtot, David Croft, Tobias Czauderna, Emek Demir, Johannes W. Dietrich, Ugur Dogrusoz, Damien Fleury, Tom Freeman, Akira Funahashi, Ralph Gauges, Peter Ghazal, Samik Ghosh, Igor Goryanin, Anja Hartmann, Robin Haw, Michael Hucka, Matthias Jeschke, Mathias John, Akiya Jouraku, Astrid Junker, Hideya Kawaji, Douglas Kell, Sohyoung Kim, Hiroaki Kitano, Christian Klukas, Kurt Kohn, Fedor Kolpakov, Nicolas Le Novère, Lu Li, Augustin Luna, Yukiko Matsuoka, Carsten Maus, Alexander Mazein, Huaiyu Mi, Stuart Moodie, Ulrike Münzner, Anushya Muruganujan, Michael Pedersen, Jacqueline Quinn, Stefan Rybacki, Sven Sahle, Chris Sander, Herbert Sauro, Esther Schmidt, Falk Schreiber, Jacky Snoep, Anatoly Sorokin, Jessica Stephens, Linda Taddeo, Carolyn Talcott, Lin Uhrmacher, Martijn van Iersel, Alice Villéger, Steven Watterson, Katja Wegner (Wengler), Sarala Wimalaratne (Dissanayake), Guanming Wu, Röbbbe Wünschiers.

20

The authors are also grateful to all the attendees of the SBGN meetings, as well as to the subscribers of the `sbgn-discuss@googlegroups.com` mailing list.

6.7 Financial Support

The development of SBGN was mainly supported by a grant from the Japanese New Energy and Industrial Technology Development Organization (NEDO, <http://www.nedo.go.jp>). The Okinawa Institute of Science and Technology (OIST, <http://www.oist.jp>), the AIST Computational Biology Research Center (AIST CBRC, <http://www.cbrc.jp/index.eng.html>), the British Biotechnology and Biological Sciences Research Council (BBSRC, <http://www.bbsrc.ac.uk>) through a Japan Partnering Award, the European Media Laboratory (EML Research gGmbH, <http://www.eml.org/english>), the Beckman Institute at the California Institute of Technology (<http://bnmc.caltech.edu>), Ontario Institute for Cancer Research (OICR, <http://oicr.on.ca>), Ontario Genomics Institute (OGI, <http://www.ontariogenomics.ca>), National Science Foundation (NSF, <http://www.nsf.gov>), USC Norris Comprehensive Cancer Center (<http://uscnorriscancer.usc.edu>), Martin Luther University Halle-Wittenberg (<http://www.uni-halle.de>), Monash University (<http://www.monash.edu>), IPK Gatersleben (<http://www.ipk-gatersleben.de/en>), University of Rostock (<http://www.uni-rostock.de>) and German Federal Ministry of Research and Education (<http://www.bmbf.de>) provided additional support for SBGN workshops. Some help was provided by the Japan Science and Technology Agency (JST, <http://www.jst.go.jp>) and the Genome Network Project of the Japanese Ministry of Education, Sports, Culture, Science, and Technology (MEXT, <http://www.mext.go.jp>) for the development of the gene regulation network aspect of SBGN, and from the Engineering and Physical Sciences Research Council (EPSRC, <http://www.epsrc.ac.uk>) during the redaction of the specification.

Complete examples of Process Description Maps

The following maps present complete examples of SBGN Process Descriptions representing biological processes. They by no means exhaust the possibilities of SBGN Process Description Level 1. 5

Figure A.1 presents an example of metabolic pathway, that exemplifies the use of the *EPNs simple chemical* and *macromolecule*, *clone marker*, the *PN process*, and the *connecting arcs consumption*, *production* and *catalysis*.

Figure A.1: Glycolysis. This example illustrates how SBGN can be used to describe metabolic pathways.

Figure A.2 presents an example of signalling pathway, that exemplifies in addition the use of the *EPN complex*, the *state variable*, the *container compartment*, the *submap*, the *PNs association* and *phenotype*, and the *connecting arc stimulation*. Note the complex IGF and IGF receptor, located on the boundary of the compartment. This position is only for user convenience. The complex has to belong to a given compartment in SBGN Process Description Level 1. 10

Figure A.3 is an expanded version of the submap present on the map present in Figure A.2. It shows the use of *tag*. 15

Figure A.4 introduces an SBGN Process Description that spans several compartments. Note that the compartment “synaptic vesicle” is not **contained** in the compartment “synaptic button” but **overlaps** it. The *simple chemical* “ACh” of the “synaptic vesicle” is not the same *EPN* than the “ACh” of the “synaptic button” and of “synaptic cleft”. The situation is similar with the compart- 20

Figure A.2: Insulin-like Growth Factor (IGF) signalling. This example shows the use of compartments and how details can be hidden by using a submap. The submap is shown on Figure A.3.

Figure A.3: The expanded submap of the previous map showing the MAPK cascade.

ments “ER” and “muscle cytosol”. The map exemplifies the use of the *PNs omitted* and *dissociation*, and the *connecting arc necessary stimulation*.

Figure A.5 introduces the use of SBGN Process Description Level 1 to encode gene regulatory networks. It also shows the use of the *empty set* and the *logical operator and*.

Figure A.4: Neuronal/Muscle signalling. A description of inter-cellular signalling using SBGN.

Figure A.5: Activated STAT1 α induction of the IRF1 gene. An example of gene regulation using logical operators.

Reference card

Print the summary of SBGN symbols on the next page for a quick reference.

Validation and consistency rules

- PD01** A map is valid if it is empty (although not very useful).. 15
- PD02** All instances of *SBGNGlyph* (see section 4.5.4) must be unique (see section 4.7).. 15 5
- PD03** The set of *SBGNNodes* linked to this node via a *SBGNArc* (its adjacent nodes) must be all belong to different entity pools (as defined by *EntityPoolNode*).. 17
- PD04** If cardinality > 1 then the descendant glyph must be displayed as a multimer.. 21
- PD05** If the EPN is drawn directly on a *Map* then *owning_compartment* is not set. We interpret this as belonging to an invisible default compartment.. 21 10
- PD06** *natures* can only use the material type (section 4.6.1), conceptual type (section 4.6.2) or physical characteristics (section 4.6.4) controlled vocabularies.. 21
- PD07** The appropriate subclass of *CloneMarker* must be used to distinguish logically identical instances of this class.. 21
- PD08** All *StateVariableDefinitions* associated with the *EntityType* must have an associated *StateVariable*.. 21 15
- PD09** All instances of *Empty Set* can be regarded as identical therefore no special decoration is used to indicate replication on the map.. 23
- PD10** The *EmptySet* must be associated with at least one *SBGNArc* (see section 4.5.7) (degree > 0).. 23 20
- PD11** If a clone marker is used it must be of type *SimpleCloneMarker*.. 24
- PD12** The *UnspecifiedEntity* cannot have cardinality > 1. This means there is no multimer glyph.. 26
- PD13** The *PerturbingAgent* cannot have cardinality > 1. This means there is no multimer glyph.. 27 25
- PD14** State variables do not need to be logically unique, therefore two or more state variables with the same name are permitted.. 28
- PD15** The *LabelledCloneMarker* must be used to indicate cloning for instances of *StatefulEPN* and its subclasses, with a must use the same. 28

See
footnote.

- PD16** Once a set of subunits are defined for an **Complex** with a given **EntityType**, then they must be used by every instance using that entity type.¹.. 32
- PD17** The set of subunits in the **Complex** does not identify it. One or more **Complexes** that contain the same set of subunits, but have different labels are **not** identical.. 32
- PD18** The subunits inside the complex must not overlap.. 33 5
- PD19** The subunits should sit above the clone marker so that they are not obscured by it.. 33
- PD20** The label should not be obscured by subunits or obscure them.. 33
- PD21** Two or more state variables with the same name are permitted.. 34
- PD22** State variables with no name set are permitted.. 34
- PD23** Subunits can also contain subunits. There is no limit on such nesting. The namespace rules below apply.. 34 10
- PD24** The subunit defines a namespace for its state variables, e.g. subunit “A” assigned a state variable “P@Ser202” and a subunit “B” assigned the same state variable can be distinguished as A:P@Ser202 and B:P@Ser202.. 34
- PD25** If the subunit is of type **Complex** then children can contain one or more **Subunit** instances.. 34 15
- PD26** If the subunit has a cardinality > 1 then this should be displayed by the **AttributeValue** (see section 4.5.28).. 34
- PD27** If **natures** contains one or more instances then these must be displayed via an **Attribute-Value**.. 34 20
- PD28** The number of **in_arcs** must be > 0.. 37
- PD29** **in_arc** can only contain instances of **ModulationArc** (see section 4.5.35) and its subclasses.. 37
- PD30** **out_arcs** must be empty.. 37
- PD31** All instances of **SubmapTerminal** (see section 4.5.32) held by this class must be logically unique.. 39 25
- PD32** **in_arcs** and **out_arcs** must be empty (i.e., degree = 0).. 39
- PD33** **in_arc** can only contain one or more instances of **LogicArc**.. 40
- PD34** **out_arc** can only contain one or more instances of **LogicArc** or **ModulationArc**.. 40
- PD35** if **operator_type** is AND or OR, then **in_arc** must contain two or more arcs.. 40 30
- PD36** if **operator_type** is NOT then **in_arc** must contain only one arc.. 40
- PD37** **out_arc** can contain only one arc.. 40
- PD38** The **in_arc** must contain one or more **FluxArcs** containing the same **flux_type** value.. 44

¹New rule.

-
- PD39** The `in_arc` may only contains `FluxArc` instances with a `flux_type` of ‘consumption’, or ‘reversible’.. 44
- PD40** The `in_arc` may only contains `FluxArc` instances with a `flux_type` of ‘consumption’, or ‘reversible’.. 44
- PD41** In addition the `in_arc` may contain zero, one or more instances of `ModulationArc`.. 44 5
- PD42** The `out_arc` must contain one or more instances of `FluxArc` with a `flux_type` or ‘production’.. 44
- PD43** If `in_arcs` contains one or more `FluxArcs` of type ‘reversible’ this process reversible.. 44
- PD44** The `EntityPoolNodes` that make up the LHS of the process should be consistent with the RHS, i.e. the process should be stoichiometrically balanced.². 44 10
- PD45** If at least one `FluxArc` associated with a `StoichiometricProcess` displays its stoichiometry via a *stoichiometry label* then all must.³. 44
- PD46** If more than one set of stoichiometries can be applied to the flux arcs of the process then the stoichiometry of the flux arcs must be displayed.. 44
- PD47** The process must be irreversible.. 45 15
- PD48** There can only be one ‘production’ `FluxArc`, with `stoichiometry` = 1.. 45
- PD49** If a `Complex` is on the RHS of the association then there must be at least 2 EPNS on the LHS.*Is this too restrictive? It prevents multimers being represented as a complex of 2 identical subunits. It is taken from v1.0 of the spec and got lost in later versions.*.. 45
- PD50** The process must be irreversible.. 45 20
- PD51** There can only be one ‘consumption `FluxArc`, with `stoichiometry` = 1.. 45
- PD52** If a `Complex` is on the LHS of the dissociation then there must be at least 2 EPNS on the RHS.*see comment in association rules.*.. 45
- PD53** The process must be irreversible.. 50
- PD54** `epns` must contain a unique set of `EntityPoolNodes`. See section 4.7 for the definition of `EntityPoolNode` uniqueness.. 50 25
- PD55** Two or more instances of `CrossReference` with the same `reference_id` value are pointing to the same element.. 57
- PD56** All values of `reference_id` must be unique within an instance of `Map`.. 58
- PD57** if the `stoichiometry` is not displayed then it is assumes to be 1⁴. 60 30
- PD58** If the `stoichiometry` > 1 then the stoichiometry must be displayed.⁵. 60

²Tracker issue 329060. If the process is stoichiometric this must make sense. The previous spec states this so this is consistent with it.

³Take from previous spec, but that said if one displays stoichiometry in a map which is too restrictive.

⁴The previous version said that the stoichiometry was unspecified, but this was before the stoichiometric process was specified. In addition since cardinality is defined explicitly the stoichiometry can often be implied.

⁵See above comment.

PD59 if `flux_type` = 'consumption' or 'reversible' then:

- The `in_node` must be an instance of `EntityPoolNode` (see section 4.5.10).
- The `out_node` must be an instance of `StoichiometricProcess` (see section 4.5.26).

. 60

PD60 if `flux_type` = 'production' then:

5

- The `in_node` must be an instance of `StoichiometricProcess` (see section 4.5.26).
- The `out_node` must be an instance of `EntityPoolNode` (see section 4.5.10).

. 60

PD61 At most one *necessary stimulation* can be assigned to a process node. Two *necessary stimulations* would imply an implicit AND or OR operator. For clarity only one *necessary stimulation* can be assigned to a *process*, and such combinations must be explicitly expressed using *logical operators*⁶.. 64

10

See
footnote.

PD62 At most one *catalysis* can be assigned to a *process*. Modulation by a catalysis arc implies that the exact biochemical mechanism underlying the process is known. In this context two *catalysis* cannot be assigned to the same process node as they represent independent reactions. Other EPNs can be assigned to the same process as a catalysis, such as modulators, stimulators, and inhibitors, and will have a multiplicative modulation on the reaction rate defined by the catalysis⁷.. 64

15

See
footnote.

PD63 The `in_node` must be an instance of `EntityPoolNode` or `LogicalOperator`.. 67

PD64 The `out_node` must be an instance of `LogicalOperator`.. 67

20

PD65 Only subclasses of `StatelessEPN` (see section 4.5.12) can contain `SimpleCloneMarkers`.. 70

PD66 At least two or more instanced of a `LabelledCloneMarker` with the same label must exist in this same in a given `Map` (see section 4.5.3).. 71

PD67 Only subclasses of `StatefulEPN` (see section 4.5.16) can contain labelled clone markers.. 71 25

PD68 All instances of `EntityPoolNode` associated with a particular `EntityType` must be of the same class.. 19

PD69 If an instance of `EntityType` contains one or more instances of `StateVariableDefinition` then the `EntityPoolNodes` associated with it must be subclasses of `StatefulEPN`.. 19

⁶Taken from the grammar section of the previous specification.

⁷Taken from the grammar section of the previous specification.

Issues postponed to future levels

D.1 Multicompartment entities

The problem of entities, such as macromolecules, spanning several compartments proved to be a challenge for the community involved in the development of SBGN Process Description Level 1. It was thus decided to leave it for a future Level. It turns out there is at the moment no obvious solution satisfactory for everyone. Three broad classes of solutions have been identified so far: 5

- One can systematically locate an *EPN* in a given *compartment*, for instance a transmembrane receptor in a membrane. However, the reactions of this entity with entities represented by *EPN* in other compartments, such as extracellular ligands and second messenger systems, will create artificial transport reactions. 10
- One can represent the domains of proteins in different compartments by *macromolecules*, and link all those macromolecules in a *complex* spanning several compartments. However, such a representation would be very confusing, implying that the domains are actually different molecules linked through non-covalent bonds. 15
- One can accept *macromolecules* that span several compartments, and represent domains as *units of information*. Those *units of information* should then be located in given compartments. To make a full use of such a representation, one should then start and end connecting arcs on given *units of information*, something prohibited by the current specification. 20

D.2 Logical combination of state variable values

The value of a *state variable* has to be perfectly defined in SBGN Process Description Level 1. If a state variable can take the alternative values 'A', 'B' and 'C', one cannot attribute it values such as 'non-A', 'A or B', 'any' or 'none'. As a consequence some biochemical processes cannot be easily represented because of the very large number of state to enumerate. The decision to forbid such a Boolean logic lies in the necessity of maintaining truth path all over an SBGN map. 25

D.3 Non-chemical entity nodes

The current specification cannot represent combinations of events and entities. For instance a variable "voltage" cannot be controlled by a difference of concentration between different entities, such as a given ion in both sides of a membrane. 30

D.4 Generics

SBGN Process Description Level 1 does not provide mechanisms to sub-class *EPNs*. There is no specific means of specifying that *macromolecules* or *nucleic acid features* X1, X2 and X2 are sub-classes of X. Therefore, any process that applies to all the subtypes of X has to be triplicated. That situation can easily generate combinatorial explosions of the number of *EPNs* or *PNs*.

5

D.5 State and transformation of compartments

In SBGN Process Description Level 1 a *compartment* is a stateless entity. It cannot carry *state variables*, and cannot be subjected to process modifying a state. As a result, a *compartment* cannot be transformed, moved, split or merged with another. If one want to represent the transformation of a compartment, one has to create the start and end compartments, and represent the transport of all the *EPNs* from one to the other. This is not satisfactory, and should be addressed in the future.

10

Revision History

E.1 Version 1.0 to Version 1.1

Below are the changes incorporated into Version 1.1 of the SBGN Process Description Level 1 specification.

5

Description	Tracker ID
Regarding modulation of reversible processes, changed “should” to “must” be represented by two <i>process</i>	
Removed “The connectors and the box move as a rigid entity” in the definition of <i>process</i>	
Changed the definition of process node to “represent processes that transform one or several EPNs into <i>one or several EPNs, identical or different</i> ”	
Changed SBO term of <i>compartment</i> From SBO:0000289 (functional compartment) to SBO:0000290 (physical compartment)	
Reorganised classification of glyphs	
Reorganised glyph section to reflect the above changes	
Revised reference card to reflect changes in glyph organisation	
Revised logic operators throughout spec to make sure input and output arcs meet before attaching to the glyph - as with processes.	
Added enumerated rules to grammar section. This is probably not complete, but should help the implementation of semantic validation by software tools. The hope is this will be refined as tools start validating maps.	
Updated UML maps and data dictionary to be consistent with rest of changes to spec.	
Definition of cardinality is ambiguous	2840996
<i>Sink and source</i> are lumped together	2726435
SBO terms are incorrect or missing.	2841261
<i>Compartment</i> description is confusing and contradictory.	2841122
<i>Clone marker</i> fill percentages unhelpful.	2841114
Use of CV for physical characteristic not clear.	2841085
continued on next page	

<i>continued from previous page</i>	
Description	Tracker ID
Definition of Cardinality is ambiguous.	2840996
input to AND on IFN example.	2804326
more SBO terms for <i>multimers</i>	2803593
Legend of figure 2.20 is incorrect	2803537
legend of figure 3.2	2802990
Compartment colouring	2745703
Errors in diag a4.	2664912
Change name of trigger glyph.	2664908
Transition should be renamed process.	2664862
Converting arcs tautological.	2664843
Example invalid.	2545870
consumption and production.	2388317
Should require circles to be distinguishable from ellipses	2219388
Figure 2.53	2162619
Reference card: production	2104471
Figure 2.42 is wrong	2104465
Mistake in the multi-cellular example	2395488
Should not prevent processes having identical in and out	2664933
No description of linking to subunit rules.	2545810
Extensively revised the grammar section. The UML diagrams have been simplified to show glyph taxonomy, and the data dictionary has been pruned to just show glyph identity. The some syntax rules have been moved into semantics and the rules reformulated to make them easier to understand.	
Eliminated duplicate rules in layout section and revised text slightly.	
Phenotype cloning?	2989007
Perturbing agent description	2940021

E.2 Version 1.1 to Version 1.2

Below are the changes incorporated into Version 1.2 of the SBGN Process Description Level 1 specification.

Description	Tracker ID
Perturbing agent description	2940021
Members of complex touching	2849273
PD Reference card error for submap glyph	3029242
